Chapter 1

Conventions and feedback

The following describes the typographical conventions and how to give feedback:

Typographical conventions

The following typographical conventions are used:

- **monospace** Denotes text that can be entered at the keyboard, such as commands, file and program names, and source code.

- **monospace** Denotes a permitted abbreviation for a command or option. The underlined text can be entered instead of the full command or option name.

- **monospace italic** Denotes arguments to commands and functions where the argument is to be replaced by a specific value.

- **monospace bold** Denotes language keywords when used outside example code.

- **italic** Highlights important notes, introduces special terminology, denotes internal cross-references, and citations.

- **bold** Highlights interface elements, such as menu names. Also used for emphasis in descriptive lists, where appropriate, and for ARM® processor signal names.

Feedback on this product

If you have any comments and suggestions about this product, contact your supplier and give:

- your name and company
• the serial number of the product
• details of the release you are using
• details of the platform you are using, such as the hardware platform, operating system type and version
• a small standalone sample of code that reproduces the problem
• a clear explanation of what you expected to happen, and what actually happened
• the commands you used, including any command-line options
• sample output illustrating the problem
• the version string of the tools, including the version number and build numbers.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:
• the title
• the number, ARM DUI 0489F
• if viewing online, the topic names to which your comments apply
• if viewing a PDF version of a document, the page numbers to which your comments apply
• a concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

ARM periodically provides updates and corrections to its documentation on the ARM Information Center, together with knowledge articles and Frequently Asked Questions (FAQs).

• ARM Support and Maintenance, http://www.arm.com/support/services/support-maintenance.php
Chapter 2
Assembler command line options

The following topics describe the ARM® Compiler toolchain assembler command line syntax and the command line options accepted by the assembler, armasm:

- Assembler command line syntax on page 2-2
- Assembler command line options on page 2-3.
2.1 Assembler command line syntax

The command for invoking the ARM assembler is:

```
armasm  {options} {inputfile}
```

where:

- `options` are commands to the assembler. You can invoke the assembler with any combination of options separated by spaces. You can specify values for some options. To specify a value for an option, use either ‘=’ (`option=value`) or a space character (`option value`).

- `inputfile` can be one or more assembly source files separated by spaces. Input files must be UAL, or pre-UAL ARM or Thumb® assembly language source files.

*Using the Compiler:*
- *Order of compiler command-line options on page 3-11.*
2.2 Assembler command line options

The following command line options are supported by the assembler:

- \texttt{--16} on page 2-4
- \texttt{--32} on page 2-5
- \texttt{--apcs=qualifier...qualifier} on page 2-5
- \texttt{--arm} on page 2-6
- \texttt{--arm_only} on page 2-6
- \texttt{--bi} on page 2-6
- \texttt{--bigend} on page 2-6
- \texttt{--brief_diagnostics} on page 2-7
- \texttt{--checkreglist} on page 2-7
- \texttt{--compatible=name} on page 2-7
- \texttt{--cpreproc} on page 2-7
- \texttt{--cpreproc_opts=options} on page 2-8
- \texttt{--cpu=list} on page 2-8
- \texttt{--cpu=name} on page 2-8
- \texttt{--debug} on page 2-9
- \texttt{--depend=dependfile} on page 2-9
- \texttt{--depend_format=string} on page 2-9
- \texttt{--device=list} on page 2-9
- \texttt{--device=name} on page 2-10
- \texttt{--diag_error=tag, tag} on page 2-10
- \texttt{--diag_remark=tag, tag} on page 2-11
- \texttt{--diag_style=style} on page 2-11
- \texttt{--diag_suppress=tag, tag} on page 2-11
- \texttt{--diag_warning=tag, tag} on page 2-12
- \texttt{--dllexport_all} on page 2-12
- \texttt{--dwarf2} on page 2-12
- \texttt{--dwarf3} on page 2-12
- \texttt{--errors=errorfile} on page 2-12
- \texttt{--execstack} on page 2-13
- \texttt{--exceptions} on page 2-13
- \texttt{--exceptions_unwind} on page 2-13
- \texttt{--fpmode=model} on page 2-13
- \texttt{--fpu=list} on page 2-14
- \texttt{--fpu=name} on page 2-14
- \texttt{-g} on page 2-16
- \texttt{--help} on page 2-16
- \texttt{-idir,dir, ...} on page 2-16
- \texttt{--keep} on page 2-16
- \texttt{--length=n} on page 2-16
- \texttt{--li} on page 2-16
- \texttt{--library_type=lib} on page 2-16
- \texttt{--licretry} on page 2-17
- \texttt{--list=file} on page 2-17
- \texttt{--list=} on page 2-18
- \texttt{--littleend} on page 2-18
-m on page 2-18
--maxcache=n on page 2-18
--md on page 2-18
--no_code_gen on page 2-18
--no_exec on page 2-18
--no_execstack on page 2-18
--no_exceptions on page 2-19
--no_exceptions_unwind on page 2-19
--no_hide_all on page 2-19
--no_project on page 2-20
--no_reduce_paths on page 2-20
--no_regs on page 2-20
--no_terminate on page 2-20
--no_unaligned_access on page 2-20
--no_warn on page 2-21
-o filename on page 2-21
--pd on page 2-21
--predefine "directive" on page 2-21
--project=filename on page 2-21
--reduce_paths on page 2-22
--regnames=none on page 2-22
--regnames=callstd on page 2-22
--regnames=all on page 2-23
--reinitialize_workdir on page 2-22
--report-if-not-wysiwyg on page 2-23
--show_cmdline on page 2-23
--split_ldm on page 2-24
--thumb on page 2-24
--thumbx on page 2-24
--unaligned_access on page 2-24
--unsafe on page 2-24
--untyped_local_labels on page 2-25
--version_number on page 2-25
--via=file on page 2-25
--vsn on page 2-25
--width=n on page 2-25
--workdir=directory on page 2-26
--xref on page 2-26.

2.2.1 --16

This option instructs the assembler to interpret instructions as Thumb® instructions using the pre-UAL Thumb syntax. This is equivalent to a CODE16 directive at the head of the source file. Use the --thumb option to specify Thumb instructions using the UAL syntax.

See also
- --thumb on page 2-24
- ARM, THUMB, THUMBX, CODE16 and CODE32 on page 6-56.
2.2.2 --32

This option is a synonym for --arm.

See also
• --arm on page 2-6.

2.2.3 --apcs=qualifier...qualifier

This option specifies whether you are using the Procedure Call Standard for the ARM Architecture (AAPCS). It can also specify some attributes of code sections.

The AAPCS forms part of the Base Standard Application Binary Interface for the ARM Architecture (BSABI) specification. By writing code that adheres to the AAPCS, you can ensure that separately compiled and assembled modules can work together.

Note

AAPCS qualifiers do not affect the code produced by the assembler. They are an assertion by the programmer that the code in inputfile complies with a particular variant of AAPCS. They cause attributes to be set in the object file produced by the assembler. The linker uses these attributes to check compatibility of files, and to select appropriate library variants.

Values for qualifier are:

- none: Specifies that inputfile does not use AAPCS. AAPCS registers are not set up. Other qualifiers are not permitted if you use none.
- /interwork, /nointerwork: /interwork specifies that the code in inputfile can interwork between ARM and Thumb safely. The default is /nointerwork.
- /inter, /nointer: Are synonyms for /interwork and /nointerwork.
- /ropi, /noropi: /ropi specifies that the code in inputfile is Read-Only Position-Independent (ROPI). The default is /noropi.
- /pic, /nopic: Are synonyms for /ropi and /noropi.
- /rwpi, /norwpi: /rwpi specifies that the code in inputfile is Read-Write Position-Independent (RWPI). The default is /norwpi.
- /fpic, /nofpic: /fpic specifies that the code in inputfile is read-only independent and references to addresses are suitable for use in a Linux shared object. The default is /nofpic.
- /hardfp, /softfp: Requests hardware or software floating-point linkage. This enables the procedure call standard to be specified separately from the version of the floating-point hardware available through the --fpu option. It is still possible to specify the procedure call standard by using the --fpu option, but ARM recommends you use --apcs. If floating-point support is not permitted (for example, because --fpu=none is specified, or because of other means), then /hardfp and /softfp are ignored. If floating-point support is permitted and the softfp calling convention is used (--fpu=softvfp or --fpu=softvfp+vp...), then /hardfp gives an error.
Note
You must specify at least one qualifier. If you specify more than one qualifier, ensure that there are no spaces or commas between the individual qualifiers in the list.

Example
armasm --apcs=/inter/ropi inputfile.s

See also
Procedure Call Standard for the ARM Architecture,

Compiler Reference:
• --apcs=qualifier...qualifier on page 3-11.

Developing Software for ARM Processors:
• Chapter 5 Interworking ARM and Thumb.

2.2.4 --arm
This option instructs the assembler to interpret instructions as ARM instructions. It does not, however, guarantee ARM-only code in the object file. This is the default. Using this option is equivalent to specifying the ARM or CODE32 directive at the start of the source file.

See also
• --32 on page 2-5
• --arm_only
• ARM, THUMB, THUMBX, CODE16 and CODE32 on page 6-56.

2.2.5 --arm_only
This option instructs the assembler to only generate ARM code. This is similar to --arm but also has the property that the assembler does not permit the generation of any Thumb code.

See also
• --arm.

2.2.6 --bi
This option is a synonym for --bigend.

See also
• --bigend
• --littleend on page 2-18

2.2.7 --bigend
This option instructs the assembler to assemble code suitable for a big-endian ARM. The default is --littleend.
2.2.8 --brief_diagnostics

This option instructs the assembler to use a shorter form of the diagnostic output. In this form, the original source line is not displayed and the error message text is not wrapped when it is too long to fit on a single line. The default is --no_brief_diagnostics.

See also
• --diag_error=tag{, tag} on page 2-10
• --diag_warning=tag{, tag} on page 2-12.

2.2.9 --checkreglist

This option instructs the assembler to check RLIST, LDM, and STM register lists to ensure that all registers are provided in increasing register number order. A warning is given if registers are not listed in order.

This option is deprecated. Use --diag_warning 1206 instead.

See also
• --diag_warning=tag{, tag} on page 2-12.

2.2.10 --compatible=name

This option specifies a second processor or architecture, name, for which the assembler generates compatible code.

When you specify a processor or architecture name using --compatible, valid values of name for both the --cpu and --compatible options are restricted to those shown in Table 2-1 and must not be from the same group.

### Table 2-1 Compatible processor or architecture combinations

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM7TDMI, 4T</td>
<td>Cortex™-M0, Cortex-M1, Cortex-M3, Cortex-M4, 7-M, 6-M, 6S-M, SC300, SC000</td>
</tr>
</tbody>
</table>

Specify --compatible=NONE to turn off all previous instances of the option on the command line.

**Example**

armasm --cpu=arm7tdmi --compatible=cortex-m3 inputfile.s

See also
• --cpu=name on page 2-8.

2.2.11 --cpreproc

This option instructs the assembler to call armcc to preprocess the input file before assembling it.
2.2.12 --cpreproc_opts=options

This option enables the assembler to pass compiler options to armcc when using the C preprocessor.

$options$ is a comma-separated list of options and their values.

**Example**

```
armasm --cpreproc --cpreproc_opts='-DDEBUG=1' inputfile.s
```

**See also**

- --cpreproc on page 2-7.

**Using the Assembler:**

- Using the C preprocessor on page 7-22.

2.2.13 --cpu=list

This option lists the supported CPU and architecture names that can be used with the --cpu name option.

**Example**

```
armasm --cpu=list
```

**See also**

- --cpu=name.

2.2.14 --cpu=**name**

This option sets the target CPU. Some instructions produce either errors or warnings if assembled for the wrong target CPU.

Valid values for name are architecture names such as 4T, 5TE, or 6T2, or part numbers such as ARM7TDMI®. The default is ARM7TDMI.

--- **Note**

ARMv7 is not a recognized ARM architecture. Using --cpu=7 generates only Thumb instructions that are common in the ARMv7-A, ARMv7-R, and ARMv7-M architectures.

---

When you specify an alternative processor or architecture name using --compatible, valid values of name for both the --cpu and --compatible options are restricted to those shown in Table 2-1 on page 2-7.

**Example**

```
armasm --cpu=Cortex-M3 inputfile.s
```
See also

- `--cpu=list` on page 2-8
- `--unsafe` on page 2-24
- `--compatible=name` on page 2-7

2.2.15 --debug

This option instructs the assembler to generate DWARF debug tables. `--debug` is a synonym for `-g`. The default is DWARF 3.

—— Note ————
Local symbols are not preserved with `--debug`. You must specify `--keep` if you want to preserve the local symbols to aid debugging.

See also

- `--dwarf2` on page 2-12
- `--dwarf3` on page 2-12
- `--keep` on page 2-16.

2.2.16 --depend=dependfile

This option instructs the assembler to save source file dependency lists to `dependfile`. These are suitable for use with make utilities.

See also

- `--md` on page 2-18
- `--depend_format=string`.

2.2.17 --depend_format=string

This option changes the format of output dependency files to UNIX-style format, for compatibility with some UNIX make programs.

The value of `string` can be one of:

unix Generates dependency files with UNIX-style path separators.

unix_escaped

Is the same as `unix`, but escapes spaces with backslash.

unix_quoted

Is the same as `unix`, but surrounds path names with double quotes.

See also

- `--depend=dependfile`.

2.2.18 --device=list

This option lists the supported device names that can be used with the `--device=name` option.
### Note

This option is deprecated.

### See also

- `--device=name`.

---

#### 2.2.19 --device=name

This option selects a specified device as the target and sets the associated processor settings.

---

### Note

This option is deprecated.

### See also

- `--device=list` on page 2-9
- `--cpu=name` on page 2-8
- `--device=name` on page 3-68 in the Compiler Reference.

---

#### 2.2.20 --diag_error=tag{, tag}

Diagnostic messages output by the assembler can be identified by a tag in the form of `{prefix}number`, where the prefix is A. The `--diag_error` option sets the diagnostic messages that have the specified tags to the error severity.

You can specify more than one tag with these options by separating each tag using a comma. You can specify the optional assembler prefix A before the tag number. If any prefix other than A is included, the message number is ignored.

Table 2-2 shows the meaning of the term severity used in the option descriptions.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Errors indicate violations in the syntactic or semantic rules of assembly language. Assembly continues, but object code is not generated.</td>
</tr>
<tr>
<td>Warning</td>
<td>Warnings indicate unusual conditions in your code that might indicate a problem. Assembly continues, and object code is generated unless any problems with an Error severity are detected.</td>
</tr>
<tr>
<td>Remark</td>
<td>Remarks indicate common, but not recommended, use of assembly language. These diagnostics are not issued by default. Assembly continues, and object code is generated unless any problems with an Error severity are detected.</td>
</tr>
</tbody>
</table>

You can set the `tag` to `warning` to treat all warnings as errors.

### See also

- `--brief_diagnostics` on page 2-7
- `--diag_warning=tag{, tag}` on page 2-12
- `--diag_suppress=tag{, tag}` on page 2-11.
2.2.21 \(--\text{diag\_remark}=\text{tag}\{, \text{tag}\}\)

Diagnostic messages output by the assembler can be identified by a tag in the form of \\
\{\text{prefix}\}\text{number}, where the prefix is A. The \(--\text{diag\_remark}\) option sets the diagnostic messages \\
that have the specified tags to the remark severity.

You can specify more than one tag with these options by separating each tag using a comma. You \\
can specify the optional assembler prefix A before the tag number. If any prefix other than A is \\
included, the message number is ignored.

\textbf{See also}
\begin{itemize}
  \item \textit{--brief\_diagnostics} on page 2-7
  \item \textit{--diag\_error}=\text{tag}\{, \text{tag}\} on page 2-10.
\end{itemize}

2.2.22 \(--\text{diag\_style}=\text{style}\)

This option instructs the assembler to display diagnostic messages using the specified \textit{style}, \\
where \textit{style} is one of:

\begin{itemize}
  \item \textit{arm} Display messages using the ARM assembler style. This is the default if \\
        \textit{--diag\_style} is not specified.
  \item \textit{ide} Include the line number and character count for the line that is in error. These \\
        values are displayed in parentheses.
  \item \textit{gnu} Display messages using the GNU style.
\end{itemize}

Choosing the option \(--\text{diag\_style}=\text{ide}\) implicitly selects the option \textit{--brief\_diagnostics}. \\
Explicitly selecting \textit{--no\_brief\_diagnostics} on the command line overrides the selection of \\
\textit{--brief\_diagnostics} implied by \textit{--diag\_style}=\text{ide}.

Selecting either the option \(--\text{diag\_style}=\text{arm}\) or the option \textit{--diag\_style}=\textit{gnu} does not imply any \\
selection of \textit{--brief\_diagnostics}.

\textbf{See also}
\begin{itemize}
  \item \textit{--brief\_diagnostics} on page 2-7
  \item \textit{--diag\_style}=\textit{style}.
\end{itemize}

2.2.23 \(--\text{diag\_suppress}=\text{tag}\{, \text{tag}\}\)

Diagnostic messages output by the assembler can be identified by a tag in the form of \\
\{\text{prefix}\}\text{number}, where the prefix is A. The \(--\text{diag\_suppress}\) option disables the diagnostic \\
messages that have the specified tags.

You can specify more than one tag with these options by separating each tag using a comma.

For example, to suppress the warning messages that have numbers 1293 and 187, use the \\
following command:

\texttt{armasm \textemdash --diag\_suppress=1293,187}

You can specify the optional assembler prefix A before the tag number. For example:

\texttt{armasm \textemdash --diag\_suppress=A1293,A187}

If any prefix other than A is included, the message number is ignored. Diagnostic message tags \\
can be cut and pasted directly into a command line.
You can also set the tag to:

- warning, to suppress all warnings
- error, to suppress all downgradeable errors.

**See also**

- `--diag_error=tag{, tag}` on page 2-10.

### 2.2.24 --diag_warning=tag{, tag}

Diagnostic messages output by the assembler can be identified by a tag in the form of `{prefix}number`, where the prefix is A. The `--diag_warning` option sets the diagnostic messages that have the specified tags to the warning severity.

You can specify more than one tag with these options by separating each tag using a comma. You can specify the optional assembler prefix A before the tag number. If any prefix other than A is included, the message number is ignored.

You can set the tag to error to downgrade the severity of all downgradeable errors to warnings.

**See also**

- `--diag_error=tag{, tag}` on page 2-10.

### 2.2.25 --dllexport_all

This option gives all exported global symbols STV_PROTECTED visibility in ELF rather than STV_HIDDEN, unless overridden by source directives.

**See also**

- `EXPORT or GLOBAL` on page 6-67.

### 2.2.26 --dwarf2

This option can be used with `--debug`, to instruct the assembler to generate DWARF 2 debug tables.

**See also**

- `--debug` on page 2-9
- `--dwarf3`.

### 2.2.27 --dwarf3

This option can be used with `--debug`, to instruct the assembler to generate DWARF 3 debug tables. This is the default if `--debug` is specified.

**See also**

- `--debug` on page 2-9
- `--dwarf2`.

### 2.2.28 --errors=errorfile

This option instructs the assembler to output error messages to `errorfile`.
2.2.29 --execstack

This option generates a .note.GNU-stack section marking the stack as executable.

You can also use the AREA directive to generate an executable .note.GNU-stack section:

```
AREA | .note.GNU-stack |,ALIGN=0,READONLY,NOALLOC,CODE
```

In the absence of --execstack and --no_execstack, the .note.GNU-stack section is not generated unless it is specified by the AREA directive.

See also

- --no_execstack on page 2-18
- AREA on page 6-61.

2.2.30 --exceptions

This option instructs the assembler to switch on exception table generation for all functions defined by FUNCTION (or PROC) and ENDFUNC (or ENDP).

See also

- --no_exceptions on page 2-19
- --exceptions_unwind
- --no_exceptions_unwind on page 2-19
- FRAME UNWIND ON on page 6-47
- FUNCTION or PROC on page 6-47
- ENDFUNC or ENDP on page 6-49
- FRAME UNWIND OFF on page 6-47.

2.2.31 --exceptions_unwind

This option instructs the assembler to produce unwind tables for functions where possible. This is the default.

For finer control, use FRAME UNWIND ON and FRAME UNWIND OFF directives.

See also

- --no_exceptions_unwind on page 2-19
- --exceptions
- --no_exceptions on page 2-19
- FRAME UNWIND ON on page 6-47
- FRAME UNWIND OFF on page 6-47
- FUNCTION or PROC on page 6-47
- ENDFUNC or ENDP on page 6-49.

2.2.32 --fpmode=model

This option specifies the floating-point model, and sets library attributes and floating-point optimizations to select the most suitable library when linking.

--- Note ---

This does not cause any changes to the code that you write.
model can be one of:

- **none**  
  Source code is not permitted to use any floating-point type or floating point instruction. This option overrides any explicit `--fpu=name` option.

- **ieee_full**  
  All facilities, operations, and representations guaranteed by the IEEE standard are available in single and double-precision. Modes of operation can be selected dynamically at runtime.

- **ieee_fixed**  
  IEEE standard with round-to-nearest and no inexact exception.

- **ieee_no_fenv**  
  IEEE standard with round-to-nearest and no exceptions. This mode is compatible with the Java floating-point arithmetic model.

- **std**  
  IEEE finite values with denormals flushed to zero, round-to-nearest and no exceptions. It is C and C++ compatible. This is the default option. Finite values are as predicted by the IEEE standard. It is not guaranteed that NaNs and infinities are produced in all circumstances defined by the IEEE model, or that when they are produced, they have the same sign. Also, it is not guaranteed that the sign of zero is that predicted by the IEEE model.

- **fast**  
  Some value altering optimizations, where accuracy is sacrificed to fast execution. This is not IEEE compatible, and is not standard C.

**Example**

```
armasm --fpmode ieee_full inputfile.s
```

**See also**

- `--fpu=name`

---

### 2.2.33 `--fpu=list`

This option lists the supported FPU names that can be used with the `--fpu=name` option.

**Example**

```
armasm --fpu=list
```

**See also**

- `--fpu=name`

---

### 2.2.34 `--fpu=name`

This option selects the target floating-point unit (FPU) architecture. If you specify this option it overrides any implicit FPU set by the `--cpu` option. The assembler produces an error if the FPU you specify explicitly is incompatible with the CPU. Floating-point instructions also produce either errors or warnings if assembled for the wrong target FPU.

The assembler sets a build attribute corresponding to name in the object file. The linker determines compatibility between object files, and selection of libraries, accordingly.

Valid values for name are:

- **none**  
  Selects no floating-point architecture. This makes your assembled object file compatible with object files built with any FPU.
vfpv3 Selects hardware floating-point unit conforming to architecture VFPv3.

vfpv3_fp16 Selects hardware floating-point unit conforming to architecture VFPv3 with half-precision floating-point extension.

vfpv3_d16 Selects hardware floating-point unit conforming to architecture VFPv3-D16.

vfpv3_d16_fp16 Selects hardware floating-point unit conforming to architecture VFPv3-D16 with half-precision floating-point extension.

vfpv4 Selects hardware floating-point unit conforming to architecture VFPv4.

vfpv4_d16 Selects hardware floating-point unit conforming to architecture VFPv4-D16.

fpv4-sp Selects hardware floating-point unit conforming to the single precision variant of architecture FPv4.

vfpv2 Selects hardware floating-point unit conforming to architecture VFPv2.

softvfp Selects software floating-point linkage. This is the default if you do not specify a --fpu option and the --cpu option selected does not imply a particular FPU.

softvfp+vfpv2 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv2.

softvfp+vfpv3 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv3.

softvfp+vfpv3_fp16 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv3_fp16.

softvfp+vfpv3_d16 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv3_d16.

softvfp+vfpv3_d16_fp16 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv3_d16_fp16.

softvfp+vfpv4 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv4.

softvfp+vfpv4_d16 Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu vfpv4_d16.

softvfp+fpv4-sp Selects a floating-point library with software floating-point linkage that uses VFP instructions. This is otherwise equivalent to using --fpu fpv4-sp.
See also
•  --fpmode=model on page 2-13.

2.2.35  -g

This option is a synonym for --debug.

See also
•  --debug on page 2-9.

2.2.36  --help

This option instructs the assembler to show a summary of the available command line options.

2.2.37  -idir{,dir, …}

This option adds directories to the source file include path. Any directories added using this option have to be fully qualified.

See also
•  GET or INCLUDE on page 6-70.

2.2.38  --keep

This option instructs the assembler to keep local labels in the symbol table of the object file, for use by the debugger.

2.2.39  --length=n

This option sets the listing page length to $n$. Length zero means an unpaged listing. The default is 66 lines.

See also
•  --list=file on page 2-17.

2.2.40  --li

This option is a synonym for --littleend.

See also
•  --littleend on page 2-18
•  --bigend on page 2-6.

2.2.41  --library_type=lib

This option enables the relevant library selection to be used at link time.

Where $lib$ can be one of:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Specifies that the full ARM runtime libraries are selected at link time. This is the default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>microlib</td>
<td>Specifies that the C micro-library (microlib) is selected at link time.</td>
</tr>
</tbody>
</table>
### Note

This option can be used with the compiler, assembler or linker when use of the libraries require more specialized optimizations.

Use this option with the linker to override all other `--library_type` options.

---

#### See also

- Building an application with microlib on page 3-7 in the Using ARM C and C++ Libraries and Floating Point Support
- `--library_type=lib` on page 3-129 in the Compiler Reference.

---

#### 2.2.42 --licretry

If you are using floating licenses, this option makes up to 10 attempts to obtain a license when you invoke `armasm`.

Use this option if your builds are failing to obtain a license from your license server, and only after you have ruled out any other problems with the network or the license server setup.

ARM recommends that you place this option in the `ARMCCn_ASMOPT` environment variable. In this way, you do not have to modify your build files.

---

#### See also

- Toolchain environment variables on page 2-14 in the Introducing the ARM Compiler toolchain
- `--licretry` on page 3-130 in the Compiler Reference
- `--licretry` on page 2-99 in the Linker Reference
- `--licretry` on page 4-51 in Using the fromelf Image Converter

---

#### 2.2.43 --list=file

This option instructs the assembler to output a detailed listing of the assembly language produced by the assembler to `file`.

If `-` is given as `file`, listing is sent to `stdout`.

Use the following command line options to control the behavior of `--list`:

- `--no_terse`
- `--width`
- `--length`
- `--xref`.

---

#### See also

- `--no_terse` on page 2-20
- `--width=n` on page 2-25
- `--length=n` on page 2-16
- `--xref` on page 2-26.
2.2.44 --list=

This option instructs the assembler to send the detailed assembly language listing to inputfile.lst.

Note

You can use --list without a filename to send the output to inputfile.lst. However, this syntax is deprecated and the assembler issues a warning. This syntax will be removed in a later release. Use --list= instead.

See also

•   --list=file on page 2-17.

2.2.45 --littleend

This option instructs the assembler to assemble code suitable for a little-endian ARM.

See also

•   --bigend on page 2-6.

2.2.46 -m

This option instructs the assembler to write source file dependency lists to stdout.

See also

•   --md.

2.2.47 --maxcache=n

This option sets the maximum source cache size to n bytes. The default is 8MB. armasm gives a warning if size is less than 8MB.

2.2.48 --md

This option instructs the assembler to write source file dependency lists to inputfile.d.

See also

•   -m.

2.2.49 --no_code_gen

This option instructs the assembler to exit after pass 1. No object file is generated. This option is useful if you only want to check the syntax of the source code or directives.

2.2.50 --no_esc

This option instructs the assembler to ignore C-style escaped special characters, such as \n and \t.

2.2.51 --no_execstack

This option generates a .note.GNU-stack section marking the stack as non-executable.
You can also use the `AREA` directive to generate a non-executable `.note.GNU-stack` section:

```
AREA | .note.GNU-stack | ,ALIGN=0,READONLY,NOALLOC
```

In the absence of `--execstack` and `--no_execstack`, the `.note.GNU-stack` section is not generated unless it is specified by the `AREA` directive.

If both the command line option and source directive are used and are different, then the stack is marked as executable.

### Table 2-3 Specifying a command line option and an `AREA` directive for GNU-stack sections

<table>
<thead>
<tr>
<th>--execstack command line option</th>
<th>--no_execstack command line option</th>
</tr>
</thead>
<tbody>
<tr>
<td>execstack AREA directive</td>
<td>execstack</td>
</tr>
<tr>
<td>no_execstack AREA directive</td>
<td>no_execstack</td>
</tr>
</tbody>
</table>

See also
- `--execstack` on page 2-13
- `AREA` on page 6-61.

#### 2.2.52 `--no_exceptions`

This option instructs the assembler to switch off exception table generation. No tables are generated. This is the default.

See also
- `--exceptions` on page 2-13
- `--exceptions_unwind` on page 2-13
- `--no_exceptions_unwind`
- `FRAME UNWIND ON` on page 6-47
- `FRAME UNWIND OFF` on page 6-47.

#### 2.2.53 `--no_exceptions_unwind`

This option instructs the assembler to produce `nounwind` tables for every function.

See also
- `--exceptions` on page 2-13
- `--no_exceptions`
- `--exceptions_unwind` on page 2-13.

#### 2.2.54 `--no_hide_all`

This option gives all exported and imported global symbols `STV_DEFAULT` visibility in ELF rather than `STV_HIDDEN`, unless overridden by source directives.

See also
- `EXPORT or GLOBAL` on page 6-67
- `IMPORT and EXTERN` on page 6-71.
2.2.55  --no_project

This option disables the use of a project template file.

--- Note ---

This option is deprecated.

See also
•  --project=filename, --no_project on page 3-174 in the Compiler Reference
•  --project=filename on page 2-21
•  --reinitialize_workdir on page 2-23
•  --workdir=directory on page 2-26.

2.2.56  --no_reduce_paths

This option disables the elimination of redundant pathname information in file paths. This is the default setting. This option is valid for Windows systems only.

See also
•  --reduce_paths on page 2-22
•  --reduce_paths, --no_reduce_paths on page 3-177 in the Compiler Reference.

2.2.57  --no_regs

This option instructs the assembler not to predefine register names.

This option is deprecated. Use --regnames=none instead.

See also
•  --regnames=none on page 2-22
•  Predeclared core register names on page 3-13 in Using the Assembler
•  Predeclared extension register names on page 3-14 in Using the Assembler
•  Predeclared XScale register names on page 3-15 in Using the Assembler
•  Predeclared coprocessor names on page 3-16 in Using the Assembler.

2.2.58  --no_terse

This option instructs the assembler to show the lines of assembly code that have been skipped because of conditional assembly in the list file. When this option is not specified on the command line, the assembler does not output the skipped assembly code to the list file.

This option turns off the terse flag. By default the terse flag is on.

See also
•  --list=file on page 2-17.

2.2.59  --no_unaligned_access

This option instructs the assembler to set an attribute in the object file to disable the use of unaligned accesses.
2.2.60 --no_warn

This option turns off warning messages.

See also
• --unaligned_access on page 2-24.

2.2.61 -o filename

This option names the output object file. If this option is not specified, the assembler creates an object filename of the form `inputfilename.o`. This option is case-sensitive.

2.2.62 --pd

This option is a synonym for --predefine.

See also
• --predefine "directive".

2.2.63 --predefine "directive"

This option instructs the assembler to pre-execute one of the SET directives. This is useful for conditional assembly.

The `directive` is one of the SETA, SETL, or SETS directives. You must enclose `directive` in quotes, for example:

```
armasm --predefine "VariableName SETA 20" inputfile.s
```

The assembler also executes a corresponding GBLL, GBLS, or GBLA directive to define the variable before setting its value.

The variable name is case-sensitive. The variables defined using the command line are global to the assembler source files specified on the command line.

Note

The command line interface of your system might require you to enter special character combinations, such as `\"`, to include strings in `directive`. Alternatively, you can use --via file to include a --predefine argument. The command line interface does not alter arguments from --via files.

See also
• --pd
• GBLA, GBLL, and GBLS on page 6-4
• SETA, SETL, and SETS on page 6-7
• Assembly conditional on a variable being defined on page 6-35.

2.2.64 --project=filename

This option enables the use of a project template file.
Project templates are files containing project information such as command line options for a particular configuration. These files are stored in the project template working directory.

——— Note ————
This option is deprecated.

See also
- `--project=filename, --no_project` on page 3-174 in the *Compiler Reference*
- `--no_project` on page 2-20
- `--reinitialize_workdir` on page 2-23
- `--workdir=directory` on page 2-26.

### 2.2.65 --reduce_paths

This option enables the elimination of redundant pathname information in file paths. This option is valid for Windows systems only.

Windows systems impose a 260 character limit on file paths. Where relative pathnames exist whose absolute names expand to longer than 260 characters, you can use the `--reduce_paths` option to reduce absolute pathname length by matching up directories with corresponding instances of `..` and eliminating the directory/`..` sequences in pairs.

——— Note ————
ARM recommends that you avoid using long and deeply nested file paths, in preference to minimizing path lengths using the `--reduce_paths` option.

See also
- `--no_reduce_paths` on page 2-20
- `--reduce_paths, --no_reduce_paths` on page 3-177 in the *Compiler Reference*.

### 2.2.66 --regnames=none

This option instructs the assembler not to predefine register names.

See also
- `--regnames=callstd`
- `--regnames=all` on page 2-23
- `--no_regs` on page 2-20
- Predeclared core register names on page 3-13 in *Using the Assembler*
- Predeclared extension register names on page 3-14 in *Using the Assembler*
- Predeclared XScale register names on page 3-15 in *Using the Assembler*
- Predeclared coprocessor names on page 3-16 in *Using the Assembler*.

### 2.2.67 --regnames=callstd

This option defines additional register names based on the AAPCS variant that you are using as specified by the `--apcs` option.

See also
- `--apcs=qualifier...qualifier` on page 2-5
2.2.68  --regnames=all

This option defines all AAPCS registers regardless of the value of --apcs.

•  --apcs=qualifier…qualifier on page 2-5
•  --regnames=none on page 2-22
•  --regnames=callstd on page 2-22.

2.2.69  --reinitialize_workdir

This option enables you to re-initialize the project template working directory.

______ Note ________
This option is deprecated.

See also
•  --reinitialize_workdir on page 3-178 in the Compiler Reference.
•  --project=filename on page 2-21
•  --no_project on page 2-20
•  --workdir=directory on page 2-26

2.2.70  --report-if-not-wysiwyg

This option instructs the assembler to report when the assembler outputs an encoding that was not directly requested in the source code. This can happen when the assembler:

•  uses a pseudo-instruction that is not available in other assemblers, for example MOV32
•  outputs an encoding that does not directly match the instruction mnemonic, for example if the assembler outputs the MN encoding when assembling the MOV instruction
•  inserts additional instructions where necessary for instruction syntax semantics, for example the assembler can insert a missing IT instruction before a conditional Thumb instruction.

2.2.71  --show_cmdline

This option outputs the command line used by the assembler. It shows the command line after processing by the assembler, and can be useful to check:

•  the command line a build system is using
•  how the assembler is interpreting the supplied command line, for example, the ordering of command line options.

The commands are shown normalized, and the contents of any via files are expanded. The output is sent to the standard output stream (stdout).

See also
•  --via=file on page 2-25.
2.2.72 --split_ldm

This option instructs the assembler to fault LDM and STM instructions with a large number of registers. Use of this option is deprecated.

This option faults LDM instructions if the maximum number of registers transferred exceeds:
- 5, for LDMs that do not load the PC
- 4, for LDMs that load the PC.

This option faults STM instructions if the maximum number of registers transferred exceeds 5.

Avoiding large multiple register transfers can reduce interrupt latency on ARM systems that:
- do not have a cache or a write buffer (for example, a cacheless ARM7TDMI)
- use zero wait-state, 32-bit memory.

Also, avoiding large multiple register transfers:
- always increases code size.
- has no significant benefit for cached systems or processors with a write buffer.
- has no benefit for systems without zero wait-state memory, or for systems with slow peripheral devices. Interrupt latency in such systems is determined by the number of cycles required for the slowest memory or peripheral access. This is typically much greater than the latency introduced by multiple register transfers.

2.2.73 --thumb

This option instructs the assembler to interpret instructions as Thumb instructions, using the UAL syntax. This is equivalent to a THUMB directive at the start of the source file.

See also
- --arm on page 2-6
- ARM, THUMB, THUMBX, CODE16 and CODE32 on page 6-56.

2.2.74 --thumbx

This option instructs the assembler to interpret instructions as ThumbEE instructions, using the UAL syntax. This is equivalent to a THUMBX directive at the start of the source file.

See also
- ARM, THUMB, THUMBX, CODE16 and CODE32 on page 6-56.

2.2.75 --unaligned_access

This option instructs the assembler to set an attribute in the object file to enable the use of unaligned accesses.

See also
- --no_unaligned_access on page 2-20.

2.2.76 --unsafe

This option enables instructions from differing architectures to be assembled without error. It changes corresponding error messages to warning messages. It also suppresses warnings about operator precedence.
See also

- `--diag_error=tag{, tag}` on page 2-10
- `--diag_warning=tag{, tag}` on page 2-12
- *Binary operators* on page 8-22 in *Using the Assembler*.

### 2.2.77 --untyped_local_labels

This option forces the assembler not to set the Thumb bit when referencing local labels in Thumb code.

See also

- *LDR pseudo-instruction* on page 3-158
- *Local labels* on page 8-12 in *Using the Assembler*.

### 2.2.78 --version_number

This option displays the version of `armasm` being used. The format is `PVVbbbb`, where:

- \(P\) is the major version
- \(VV\) is the minor version
- \(bbbb\) is the build number.

For example, version 5.01 build 0019 is displayed as 5010019.

See also

- `--vsn`
- `--help` on page 2-16.

### 2.2.79 --via=file

This option instructs the assembler to open `file` and read in command line arguments to the assembler.

See also

- Appendix B *Via File Syntax* in the *Compiler Reference*.

### 2.2.80 --vsn

This option displays the version information and license details. For example:

```
>armasm --vsn
ARM Assembler, N.nn [Build num]
license_type
Software supplied by: ARM Limited
```

See also

- `--version_number`
- `--help` on page 2-16.

### 2.2.81 --width=n

This option sets the listing page width to \(n\). The default is 79 characters.
See also
• --list=file on page 2.17.

2.2.82 --workdir=directory

This option enables you to provide a working directory for a project template.

_____ Note _______
This option is deprecated.

See also
• --project=filename on page 2.21
• --no_project on page 2.20
• --reinitialize_workdir on page 2.23
• --workdir=directory on page 3.226 in the Compiler Reference.

2.2.83 --xref

This option instructs the assembler to list cross-referencing information on symbols, including where they were defined and where they were used, both inside and outside macros. The default is off.

See also
• --list=file on page 2.17.
Chapter 3
ARM and Thumb Instructions

The following topics describe the ARM, Thumb (all versions), and ThumbEE instructions supported by the ARM assembler:

• Instruction summary on page 3-2
• Instruction width specifiers on page 3-8
• Memory access instructions on page 3-9
• General data processing instructions on page 3-44
• Multiply instructions on page 3-75
• Saturating instructions on page 3-96
• Parallel instructions on page 3-101
• Packing and unpacking instructions on page 3-108
• Branch and control instructions on page 3-115
• Coprocessor instructions on page 3-124
• Miscellaneous instructions on page 3-133
• ThumbEE instructions on page 3-150
• Pseudo-instructions on page 3-154.
• Condition codes on page 3-162

Some instruction sections have an Architectures subsection. Instructions that do not have an Architecture subsection are available in all versions of the ARM instruction set, and all versions of the Thumb instruction set.
3.1 Instruction summary

Table 3-1 gives an overview of the instructions available in the ARM, Thumb, and ThumbEE instruction sets. Use it to locate individual instructions and pseudo-instructions.

**Note**

Unless stated otherwise, ThumbEE instructions are identical to Thumb instructions.

### Table 3-1 Location of instructions

a. Entries in the Architecture column have the following meanings:

- All: These instructions are available in all versions of the ARM architecture.
- 5: These instructions are available in the ARMv5T*, ARMv6*, and ARMv7 architectures.
- 5E: These instructions are available in the ARMv5TE, ARMv6*, and ARMv7 architectures.
- 6: These instructions are available in the ARMv6* and ARMv7 architectures.
- 6M: These instructions are available in the ARMv6-M and ARMv7 architectures.
- x6M: These instructions are not available in the ARMv6-M architecture.
- 7: These instructions are available in the ARMv7 architectures.
- 7M: These instructions are available in the ARMv7-M architecture, including ARMv7E-M implementations.
- x7M: These instructions are not available in the ARMv6-M or ARMv7-M architecture, or any ARMv7E-M implementation.
- 7EM: These instructions are available in ARMv7E-M implementations but not in the ARMv7-M or ARMv6-M architecture.
- 7R: These instructions are available in the ARMv7-R architecture.
- 7MP: These instructions are available in ThumbEE variants of the ARM architecture.
- EE: These instructions are available in ThumbEE variants of the ARM architecture.
- J: This instruction is available in the ARMv5TEJ, ARMv6*, and ARMv7 architectures.
- K: These instructions are available in the ARMv6K, and ARMv7 architectures.
- T: These instructions are available in ARMv4T, ARMv5T*, ARMv6*, and ARMv7 architectures.
- T2: These instructions are available in the ARMv6T2 and above architectures.
- XScale: These instructions are available in XScale versions of the ARM architecture.
- Z: This instruction is available if Security Extensions are implemented.
3.2 Instruction width specifiers

The instruction width specifiers `.W` and `.N` control the instruction size of Thumb code assembled for ARMv6T2 or later.

In Thumb code (ARMv6T2 or later) the `.W` width specifier forces the assembler to generate a 32-bit encoding, even if a 16-bit encoding is available. The `.W` specifier has no effect when assembling to ARM code.

In Thumb code the `.N` width specifier forces the assembler to generate a 16-bit encoding. In this case, if the instruction cannot be encoded in 16 bits or if `.N` is used in ARM code, the assembler generates an error.

If you use an instruction width specifier, you must place it immediately after the instruction mnemonic and any condition code, for example:

```assembly
BCS.W label ; forces 32-bit instruction even for a short branch
B.N label ; faults if label out of range for 16-bit instruction
```
3.3 Memory access instructions

This section contains the following subsections:

- **LDR and STR (immediate offset) on page 3-11**
  Load and Store with immediate offset, pre-indexed immediate offset, or post-indexed immediate offset.

- **LDR and STR (register offset) on page 3-14**
  Load and Store with register offset, pre-indexed register offset, or post-indexed register offset.

- **LDR and STR, unprivileged on page 3-17**
  Load and Store, with User mode privilege.

- **LDR (PC-relative) on page 3-19**
  Load register. The address is an offset from the PC.

- **LDR (register-relative) on page 3-21**
  Load register. The address is an offset from a base register.

- **ADR (PC-relative) on page 3-24**
  Load a PC-relative address.

- **ADR (register-relative) on page 3-26**
  Load a register-relative address.

- **PLD, PLDW, and PLI on page 3-28**
  Preload an address for the future.

- **LDM and STM on page 3-30**
  Load and Store Multiple Registers.

- **PUSH and POP on page 3-33**
  Push low registers, and optionally the LR, onto the stack.
  Pop low registers, and optionally the PC, off the stack.

- **RFE on page 3-35**
  Return From Exception.

- **SRS on page 3-37**
  Store Return State.

- **LDREX and STREX on page 3-39**
  Load and Store Register Exclusive.

- **CLREX on page 3-42**
  Clear Exclusive.

- **SWP and SWPB on page 3-43**
  Swap data between registers and memory.
Note

There is also an LDR pseudo-instruction. This pseudo-instruction either assembles to an LDR instruction, or to a MOV or MVN instruction.

See also

Concepts

Using the Assembler:
• Memory accesses on page 5-27.

Reference
• LDR pseudo-instruction on page 3-158.
3.3.1 LDR and STR (immediate offset)

Load and Store with immediate offset, pre-indexed immediate offset, or post-indexed immediate offset.

**Syntax**

```
op{type}{cond} Rt, [Rn {, #offset}] ; immediate offset
op{type}{cond} Rt, [Rn, #offset]! ; pre-indexed
op{type}{cond} Rt, [Rn], #offset ; post-indexed
opD{cond} Rt, Rt2, [Rn {, #offset}] ; immediate offset, doubleword
opD{cond} Rt, Rt2, [Rn, #offset]! ; pre-indexed, doubleword
opD{cond} Rt, Rt2, [Rn], #offset ; post-indexed, doubleword
```

where:

- **op** can be either:
  - LDR Load Register
  - STR Store Register.

- **type** can be any one of:
  - B unsigned Byte (Zero extend to 32 bits on loads.)
  - SB signed Byte (LDR only. Sign extend to 32 bits.)
  - H unsigned Halfword (Zero extend to 32 bits on loads.)
  - SH signed Halfword (LDR only. Sign extend to 32 bits.)
  - omitted, for Word.

- **cond** is an optional condition code.

- **Rt** is the register to load or store.

- **Rn** is the register on which the memory address is based.

- **offset** is an offset. If offset is omitted, the address is the contents of Rn.

- **Rt2** is the additional register to load or store for doubleword operations.

Not all options are available in every instruction set and architecture.
Offset ranges and architectures

Table 3-2 shows the ranges of offsets and availability of these instructions.

<td>Not available</td>
<td>T-2EE</td>
</tr>
</tbody>
</table>

<sup>a</sup> For word loads, Rt can be the PC. A load to the PC causes a branch to the address loaded. In ARMv4, bits[1:0] of the address loaded must be 0b00. In ARMv5T and above, bits[1:0] must not be 0b10, and if bit[0] is 1, execution continues in Thumb state, otherwise execution continues in ARM state.

<sup>b</sup> Rt and Rn must be in the range R0-R7.

<sup>c</sup> Must be divisible by 4.

<sup>d</sup> Must be divisible by 2.

<sup>e</sup> Rt must be in the range R0-R7.

Register restrictions

Rn must be different from Rt in the pre-index and post-index forms.

Doubleword register restrictions

Rn must be different from Rt2 in the pre-index and post-index forms.

For Thumb instructions, you must not specify SP or PC for either Rt or Rt2.

For ARM instructions:

- Rt must be an even-numbered register
- Rt must not be LR
- it is strongly recommended that you do not use R12 for Rt
- Rt2 must be R(t + 1).
Use of PC

In ARM instructions:

- You can use PC for \( R_t \) in `LDR` word instructions and PC for \( R_n \) in `LDR` instructions.
- You can use PC for \( R_t \) in `STR` word instructions and PC for \( R_n \) in `STR` instructions with immediate offset syntax (that is the forms that do not writeback to the \( R_n \)). However, these are deprecated in ARMv6T2 and above.

Other uses of PC are not permitted in these ARM instructions.

In Thumb instructions you can use PC for \( R_t \) in `LDR` word instructions and PC for \( R_n \) in `LDR` instructions. Other uses of PC in these Thumb instructions are not permitted.

Use of SP

You can use SP for \( R_n \).

In ARM, you can use SP for \( R_t \) in word instructions. You can use SP for \( R_t \) in non-word instructions in ARM code but this is deprecated in ARMv6T2 and above.

In Thumb, you can use SP for \( R_t \) in word instructions only. All other use of SP for \( R_t \) in these instructions are not permitted in Thumb code.

Examples

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>LDR r8,[r10]</code></td>
<td>loads R8 from the address in R10.</td>
</tr>
<tr>
<td><code>LDRNE r2,[r5,#960]!</code></td>
<td>(conditionally) loads R2 from a word 960 bytes above the address in R5, and increments R5 by 960.</td>
</tr>
<tr>
<td><code>STR r2,[r9,#consta-struc]</code></td>
<td>consta-struc is an expression evaluating to a constant in the range 0-4095.</td>
</tr>
</tbody>
</table>

- `Condition codes` on page 3-162.
3.3.2 LDR and STR (register offset)

Load and Store with register offset, pre-indexed register offset, or post-indexed register offset.

**Syntax**

\[
\text{op\{type\}\{cond\} \ R_t, [\ R_n, +/-R_m \ \{, \ shift\}] \ ; \ \text{register offset} \\
\text{op\{type\}\{cond\} \ R_t, [\ R_n, +/-R_m \ \{, \ shift\}]! \ ; \ \text{pre-indexed} \ ; \ \text{ARM only} \\
\text{op\{cond\} \ R_t, \ R_t2, [\ R_n, +/-R_m] \ ; \ \text{register offset, doubleword} \ ; \ \text{ARM only} \\
\text{op\{cond\} \ R_t, \ R_t2, [\ R_n, +/-R_m]! \ ; \ \text{pre-indexed, doubleword} \ ; \ \text{ARM only} \\
\text{op\{cond\} \ R_t, \ R_t2, [\ R_n] \ ; \ \text{post-indexed, doubleword} \ ; \ \text{ARM only}
\]

where:

- \text{op} \ can be either:
  - \text{LDR} \ Load Register
  - \text{STR} \ Store Register.

- \text{type} \ can be any one of:
  - \text{B} \ unsigned \ Byte \ (Zero \ extend \ to \ 32 \ bits \ on \ loads.)
  - \text{SB} \ signed \ Byte \ (LDR \ only. \ Sign \ extend \ to \ 32 \ bits.)
  - \text{H} \ unsigned \ Halfword \ (Zero \ extend \ to \ 32 \ bits \ on \ loads.)
  - \text{SH} \ signed \ Halfword \ (LDR \ only. \ Sign \ extend \ to \ 32 \ bits.)
  - \text{-} \ omitted, \ for \ Word.

- \text{cond} \ is an optional condition code.

- \text{Rt} \ is the register to load or store.

- \text{Rn} \ is the register on which the memory address is based.

- \text{Rm} \ is a register containing a value to be used as the offset. \text{-Rm} \ is not permitted in Thumb code.

- \text{shift} \ is an optional shift.

- \text{Rt2} \ is the additional register to load or store for doubleword operations.

Not all options are available in every instruction set and architecture.

**Offset register and shift options**

Table 3-3 shows the ranges of offsets and availability of these instructions.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>+/-Rm</th>
<th>shift</th>
<th>Arch.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM, word or byte (^b)</td>
<td>+/-Rm</td>
<td>LSL #0-31, LSR #1-32</td>
<td>All</td>
</tr>
<tr>
<td>ARM, signed byte, halfword, or signed halfword</td>
<td>+/-Rm</td>
<td>Not available</td>
<td>All</td>
</tr>
<tr>
<td>ARM, doubleword</td>
<td>+/-Rm</td>
<td>Not available</td>
<td>v5TE +</td>
</tr>
</tbody>
</table>
Register restrictions

In the pre-index and post-index forms:
• \( R_n \) must be different from \( R_t \)
• \( R_n \) must be different from \( R_m \) in architectures before ARMv6.

Doubleword register restrictions

For ARM instructions:
• \( R_t \) must be an even-numbered register
• \( R_t \) must not be LR
• it is strongly recommended that you do not use R12 for \( R_t \)
• \( R_{t2} \) must be \( R(t + 1) \)
• \( R_m \) must be different from \( R_t \) and \( R_{t2} \) in LDRD instructions
• \( R_n \) must be different from \( R_{t2} \) in the pre-index and post-index forms.

Use of PC

In ARM instructions:
• You can use PC for \( R_t \) in LDR word instructions, and you can use PC for \( R_n \) in LDR instructions with register offset syntax (that is the forms that do not writeback to the \( R_n \)).
• You can use PC for \( R_t \) in STR word instructions, and you can use PC for \( R_n \) in STR instructions with register offset syntax (that is the forms that do not writeback to the \( R_n \)). However, these are deprecated in ARMv6T2 and above.

Other uses of PC are not permitted in ARM instructions.

In Thumb instructions you can use PC for \( R_t \) in LDR word instructions. Other uses of PC in these Thumb instructions are not permitted.

Use of SP

You can use SP for \( R_n \).
In ARM, you can use SP for \( r_t \) in word instructions. You can use SP for \( r_t \) in non-word ARM instructions but this is deprecated in ARMv6T2 and above.

You can use SP for \( r_m \) in ARM instructions but this is deprecated in ARMv6T2 and above.

In Thumb, you can use SP for \( r_t \) in word instructions only. All other use of SP for \( r_t \) in these instructions are not permitted in Thumb code.

Use of SP for \( r_m \) is not permitted in Thumb state.

**See also**

**Reference**

- Memory access instructions on page 3-9
- Condition codes on page 3-162.
3.3.3 LDR and STR, unprivileged

Unprivileged load and Store, byte, halfword, or word.

When these instructions are executed by privileged software, they access memory with the same restrictions as they would have if they were executed by unprivileged software.

When executed by unprivileged software these instructions behave in exactly the same way as the corresponding load or store instruction, for example LDRSBT behaves in the same way as LDRSB.

Syntax

```plaintext
op{type}T{cond} Rt, [Rn {, #offset}] ; immediate offset (32-bit Thumb only)
op{type}T{cond} Rt, [Rn] {, #offset} ; post-indexed (ARM only)
op{type}T{cond} Rt, [Rn], +/-Rm {, shift} ; post-indexed (register) (ARM only)
```

where:

- `op` can be either:
  - LDR: Load Register
  - STR: Store Register.

- `type` can be any one of:
  - B: unsigned Byte (Zero extend to 32 bits on loads.)
  - SB: signed Byte (LDR only. Sign extend to 32 bits.)
  - H: unsigned Halfword (Zero extend to 32 bits on loads.)
  - SH: signed Halfword (LDR only. Sign extend to 32 bits.)
  - omitted, for Word.

- `cond` is an optional condition code.

- `Rt` is the register to load or store.

- `Rn` is the register on which the memory address is based.

- `offset` is an offset. If offset is omitted, the address is the value in `Rn`.

- `Rm` is a register containing a value to be used as the offset. `Rm` must not be PC.

- `shift` is an optional shift.
Offset ranges and architectures

Table 3-2 on page 3-12 shows the ranges of offsets and availability of these instructions.

Table 3-4 Offsets and architectures, LDR/STR (User mode)

3.3.4 LDR (PC-relative)

Load register. The address is an offset from the PC.

Syntax

LDR{type}{cond}{.W} Rt, label
LDRD{cond} Rt, Rt2, label ; Doubleword

where:

- **type** can be any one of:
  - B: unsigned Byte (Zero extend to 32 bits on loads.)
  - SB: signed Byte (LDR only. Sign extend to 32 bits.)
  - H: unsigned Halfword (Zero extend to 32 bits on loads.)
  - SH: signed Halfword (LDR only. Sign extend to 32 bits.)
  - omitted, for Word.

- **cond** is an optional condition code.

- **.W** is an optional instruction width specifier.

- **Rt** is the register to load or store.

- **Rt2** is the second register to load or store.

- **label** is a PC-relative expression.

**Note**

Equivalent syntaxes are available for the STR instruction in ARM code but they are deprecated in ARMv6T2 and above.

Offset range and architectures

The assembler calculates the offset from the PC for you. The assembler generates an error if **label** is out of range.

**Table 3-5** shows the possible offsets between label and the current instruction.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Offset range</th>
<th>Architectures</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM LDR, LDRB, LDRSB, LDRH, LDRSH a</td>
<td>+/- 4095</td>

</tr>
<tr>
<td>32-bit Thumb LDRD</td>
<td>+/- 1020 b</td>
<td>v6T2, v7</td>
</tr>
<tr>
<td>16-bit Thumb LDR c</td>
<td>0-1020 b</td>
<td>All T</td>
</tr>
</tbody>
</table>

---

a. For word loads, Rt can be the PC. A load to the PC causes a branch to the address loaded. In ARMv4, bits[1:0] of the address loaded must be 0b00. In ARMv5T and above, bits[1:0] must not be 0b10, and if bit[0] is 1, execution continues in Thumb state, otherwise execution continues in ARM state.

b. Must be a multiple of 4.
c. Rt must be in the range R0-R7. There are no byte, halfword, or doubleword 16-bit instructions.

—— Note ———

In ARMv7-M, LDR (PC-relative) instructions must be on a word-aligned address.

LDR (PC-relative) in 32-bit Thumb

You can use the .W width specifier to force LDR to generate a 32-bit instruction in Thumb code. LDR.W always generates a 32-bit instruction, even if the target could be reached using a 16-bit LDR.

For forward references, LDR without .W always generates a 16-bit instruction in Thumb code, even if that results in failure for a target that could be reached using a 32-bit Thumb LDR instruction.

Doubleword register restrictions

For 32-bit Thumb instructions, you must not specify SP or PC for either Rt or Rt2.

For ARM instructions:
• Rt must be an even-numbered register
• Rt must not be LR
• it is strongly recommended that you do not use R12 for Rt
• Rt2 must be R(t + 1).

Use of SP

In ARM, you can use SP for Rt in LDR word instructions. You can use SP for Rt in LDR non-word ARM instructions but this is deprecated in ARMv6T2 and above.

In Thumb, you can use SP for Rt in LDR word instructions only. All other uses of SP in these instructions are not permitted in Thumb code.

• Memory access instructions on page 3-9
• Condition codes on page 3-162.
3.3.5 LDR (register-relative)

Load register. The address is an offset from a base register.

**Syntax**

LDR{type}{cond}{.W} Rt, label

LDRD{cond} Rt, Rt2, label ; Doubleword

where:

- **type** can be any one of:
  - B  unsigned Byte (Zero extend to 32 bits on loads.)
  - SB signed Byte (LDR only. Sign extend to 32 bits.)
  - H  unsigned Halfword (Zero extend to 32 bits on loads.)
  - SH signed Halfword (LDR only. Sign extend to 32 bits.)
  - omitted, for Word.

- **cond** is an optional condition code.

- **.W** is an optional instruction width specifier.

- **Rt** is the register to load or store.

- **Rt2** is the second register to load or store.

- **label** is a symbol defined by the FIELD directive. *label* specifies an offset from the base register which is defined using the MAP directive.

*label* must be within a limited distance of the value in the base register.
Offset range and architectures

The assembler calculates the offset from the base register for you. The assembler generates an error if label is out of range.

Table 3-5 on page 3-19 shows the possible offsets between label and the current instruction.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Offset range</th>
<th>Architectures</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>16-bit ThumbEE LDR, base register is R10&lt;sup&gt;e&lt;/sup&gt;</td>
<td>0 to 124&lt;sup&gt;b&lt;/sup&gt;</td>
<td>T-2EE</td>
</tr>
</tbody>
</table>

<sup>a</sup> For word loads, Rt can be the PC. A load to the PC causes a branch to the address loaded. In ARMv4, bits[1:0] of the address loaded must be 0b00. In ARMv5T and above, bits[1:0] must not be 0b10, and if bit[0] is 1, execution continues in Thumb state, otherwise execution continues in ARM state.
<sup>b</sup> Must be a multiple of 4.
<sup>c</sup> Must be a multiple of 2.
<sup>d</sup> Must be a multiple of 4.
<sup>e</sup> Must be in the range R0-R7.

LDR (register-relative) in 32-bit Thumb

You can use the .W width specifier to force LDR to generate a 32-bit instruction in Thumb code. LDR.W always generates a 32-bit instruction, even if the target could be reached using a 16-bit LDR.

For forward references, LDR without .W always generates a 16-bit instruction in Thumb code, even if that results in failure for a target that could be reached using a 32-bit Thumb LDR instruction.

Doubleword register restrictions

For 32-bit Thumb instructions, you must not specify SP or PC for either Rt or Rt2.

For ARM instructions:
- Rt must be an even-numbered register
- Rt must not be LR
- It is strongly recommended that you do not use R12 for Rt
• \( R_t2 \) must be \( R(\tau + 1) \).

**Use of PC**

You can use PC for \( R_t \) in word instructions. Other uses of PC are not permitted in these instructions.

**Use of SP**

In ARM, you can use SP for \( R_t \) in word instructions. You can use SP for \( R_t \) in non-word ARM instructions but this is deprecated in ARMv6T2 and above.

In Thumb, you can use SP for \( R_t \) in word instructions only. All other use of SP for \( R_t \) in these instructions are not permitted in Thumb code.

3.3.6 ADR (PC-relative)

ADR generates a PC-relative address in the destination register, for a label in the current area.

**Syntax**

```assembly
ADR{cond}{.W} Rd, label
```

where:

- `cond` is an optional condition code.
- `.W` is an optional instruction width specifier.
- `Rd` is the destination register to load.
- `label` is a PC-relative expression.

`label` must be within a limited distance of the current instruction.

**Usage**

ADR produces position-independent code, because the assembler generates an instruction that adds or subtracts a value to the PC.

Use the ADRL pseudo-instruction to assemble a wider range of effective addresses.

`label` must evaluate to an address in the same assembler area as the ADR instruction.

If you use ADR to generate a target for a BX or BLX instruction, it is your responsibility to set the Thumb bit (bit 0) of the address if the target contains Thumb instructions.

**Offset range and architectures**

The assembler calculates the offset from the PC for you. The assembler generates an error if `label` is out of range.

Table 3-5 on page 3-19 shows the possible offsets between label and the current instruction.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Offset range</th>
<th>Architectures</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM ADR</td>
<td>See <a href="#">Operand2 as a constant</a> on page 3-45</td>
<td>All</td>
</tr>
<tr>
<td>32-bit Thumb ADR</td>
<td>+/- 4095</td>
<td>v6T2, v7</td>
</tr>
<tr>
<td>16-bit Thumb ADR</td>
<td>0-1020</td>
<td>All T</td>
</tr>
</tbody>
</table>

a. Rd must be in the range R0-R7.

b. Must be a multiple of 4.

**ADR in 32-bit Thumb**

You can use the `.W` width specifier to force ADR to generate a 32-bit instruction in Thumb code. ADR with `.W` always generates a 32-bit instruction, even if the address can be generated in a 16-bit instruction.

For forward references, ADR without `.W` always generates a 16-bit instruction in Thumb code, even if that results in failure for an address that could be generated in a 32-bit Thumb ADD instruction.
Restrictions

In Thumb code, \( R_d \) cannot be \( PC \) or \( SP \).

In ARM code, \( R_d \) can be \( PC \) or \( SP \) but use of \( SP \) is deprecated in ARMv6T2 and above.

- *AREA* on page 6-61
- *Condition codes* on page 3-162.
3.3.7 ADR (register-relative)

ADR generates a register-relative address in the destination register, for a label defined in a storage map.

Syntax

ADR{cond}{.W} Rd, label

where:

cond is an optional condition code.

.W is an optional instruction width specifier.

Rd is the destination register to load.

label is a symbol defined by the FIELD directive. label specifies an offset from the base register which is defined using the MAP directive. label must be within a limited distance from the base register.

Usage

ADR generates code to easily access named fields inside a storage map.

Use the ADRL pseudo-instruction to assemble a wider range of effective addresses.

Restrictions

In Thumb code:

- Rd cannot be PC
- Rd can be SP only if the base register is SP.

Offset range and architectures

The assembler calculates the offset from the base register for you. The assembler generates an error if label is out of range.

Table 3-5 on page 3-19 shows the possible offsets between label and the current instruction.

Table 3-8 register-relative offsets

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Offset range</th>
<th>Architectures</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM ADR</td>
<td>See Operand2 as a constant on page 3-45</td>
<td>All</td>
</tr>
<tr>
<td>32-bit Thumb ADR</td>
<td>+/- 4095</td>
<td>v6T2, v7</td>
</tr>
<tr>
<td>16-bit Thumb ADR, base register is SP&lt;sup&gt;a&lt;/sup&gt;</td>
<td>0-1020&lt;sup&gt;b&lt;/sup&gt;</td>
<td>All T</td>
</tr>
</tbody>
</table>

<sup>a</sup> Rd must be in the range R0-R7 or SP. If Rd is SP, the offset range is -508 to 508 and must be a multiple of 4.

<sup>b</sup> Must be a multiple of 4.

ADR in 32-bit Thumb

You can use the .W width specifier to force ADR to generate a 32-bit instruction in Thumb code. ADR with .W always generates a 32-bit instruction, even if the address can be generated in a 16-bit instruction.
For forward references, ADR without .W, with base register SP, always generates a 16-bit instruction in Thumb code, even if that results in failure for an address that could be generated in a 32-bit Thumb ADD instruction.

- ADRL pseudo-instruction on page 3-155
- Condition codes on page 3-162.
3.3.8 PLD, PLDW, and PLI

Preload Data and Preload Instruction. The processor can signal the memory system that a data or instruction load from an address is likely in the near future.

**Syntax**

\[
\text{PL\{cond\}} \ [Rn\{, \#\text{offset}\}]
\]

\[
\text{PL\{cond\}} \ [Rn, +/-Rm\{, \text{shift}\}]
\]

\[
\text{PL\{cond\}} \ \text{label}
\]

where:

- **type** can be one of:
  - D Data address
  - DW Data address with intention to write
  - I Instruction address.

- **type** cannot be DW if the syntax specifies label.

- **cond** is an optional condition code.

- **Note**

  **cond** is permitted only in 32-bit Thumb code, using a preceding IT instruction. This is an unconditional instruction in ARM and you must not use **cond**.

- **Rn** is the register on which the memory address is based.

- **offset** is an immediate offset. If offset is omitted, the address is the value in \( Rn \).

- **Rm** is a register containing a value to be used as the offset.

- **shift** is an optional shift.

- **label** is a PC-relative expression.

**Range of offset**

The offset is applied to the value in \( Rn \) before the preload takes place. The result is used as the memory address for the preload. The range of offsets permitted is:

- -4095 to +4095 for ARM instructions
- -255 to +4095 for 32-bit Thumb instructions, when \( Rn \) is not PC.
- -4095 to +4095 for 32-bit Thumb instructions, when \( Rn \) is PC.

The assembler calculates the offset from the PC for you. The assembler generates an error if **label** is out of range.

**Register or shifted register offset**

In ARM, the value in \( Rn \) is added to or subtracted from the value in \( Rn \). In 32-bit Thumb, the value in \( Rn \) can only be added to the value in \( Rn \). The result used as the memory address for the preload.

The range of shifts permitted is:

- LSL #0 to #3 for 32-bit Thumb instructions
• Any one of the following for ARM instructions:
  — LSL #0 to #31
  — LSR #1 to #32
  — ASR #1 to #32
  — ROR #1 to #31
  — RRX

Address alignment for preloads

No alignment checking is performed for preload instructions.

Register restrictions

\( R_m \) must not be PC. For Thumb instructions \( R_m \) must also not be SP.
\( R_n \) must not be PC for Thumb instructions of the syntax \( \text{PLD}\{\text{cond}\}: [R_n, +/-R_m, \#\text{shift}] \).

Architectures

ARM PLD is available in ARMv5TE and above.
32-bit Thumb PLD is available in ARMv6T2 and above.
PLDW is available only in ARMv7 and above that implement the Multiprocessing Extensions.
PLI is available only in ARMv7 and above.
There are no 16-bit Thumb PLD, PLDW, or PLI instructions.
These are hint instructions, and their implementation is optional. If they are not implemented, they execute as NOPs.

Reference

• Condition codes on page 3-162.
3.3.9 LDM and STM

Load and Store Multiple registers. Any combination of registers R0 to R15 (PC) can be transferred in ARM state, but there are some restrictions in Thumb state.

Syntax

\[ \text{op}\{\text{addr\_mode}\}\{\text{cond}\}\ Rn!\{\}, \ \text{reglist}\{\wedge}\]  

where:

- \(\text{op}\) can be either:
  - \(LDM\) Load Multiple registers
  - \(STM\) Store Multiple registers.

- \(\text{addr\_mode}\) is any one of the following:
  - \(IA\) Increment address After each transfer. This is the default, and can be omitted.
  - \(IB\) Increment address Before each transfer (ARM only).
  - \(DA\) Decrement address After each transfer (ARM only).
  - \(DB\) Decrement address Before each transfer.

You can also use the stack oriented addressing mode suffixes, for example, when implementing stacks.

- \(\text{cond}\) is an optional condition code.

- \(\text{Rn}\) is the base register, the ARM register holding the initial address for the transfer. \(\text{Rn}\) must not be PC.

- \(!\) is an optional suffix. If \(!\) is present, the final address is written back into \(\text{Rn}\).

- \(\text{reglist}\) is a list of one or more registers to be loaded or stored, enclosed in braces. It can contain register ranges. It must be comma separated if it contains more than one register or register range.

- \(^\wedge\) is an optional suffix, available in ARM state only. You must not use it in User mode or System mode. It has the following purposes:
  - If the instruction is \(LDM\) (with any addressing mode) and \(\text{reglist}\) contains the PC (R15), in addition to the normal multiple register transfer, the SPSR is copied into the CPSR. This is for returning from exception handlers. Use this only from exception modes.
  - Otherwise, data is transferred into or out of the User mode registers instead of the current mode registers.

Restrictions on reglist in 32-bit Thumb instructions

In 32-bit Thumb instructions:
- the SP cannot be in the list
- the PC cannot be in the list in an \(STM\) instruction
- the PC and LR cannot both be in the list in an \(LDM\) instruction
- there must be two or more registers in the list.

If you write an \(STM\) or \(LDM\) instruction with only one register in reglist, the assembler automatically substitutes the equivalent \(STR\) or \(LDR\) instruction. Be aware of this when comparing disassembly listings with source code.
You can use the --diag_warning 1645 assembler command line option to check when an instruction substitution occurs.

**Restrictions on reglist in ARM instructions**

ARM store instructions can have SP and PC in the reglist but these instructions that include SP or PC in the reglist are deprecated in ARMv6T2 and above.

ARM load instructions can have SP and PC in the reglist but these instructions that include SP in the reglist or both PC and LR in the reglist are deprecated in ARMv6T2 and above.

**16-bit instructions**

16-bit versions of a subset of these instructions are available in Thumb code.

The following restrictions apply to the 16-bit instructions:

- all registers in reglist must be Lo registers
- \( R_n \) must be a Lo register
- addr_mode must be omitted (or IA), meaning increment address after each transfer
- writeback must be specified for STM instructions
- writeback must be specified for LDM instructions where \( R_n \) is not in the reglist.

--- Note ---

16-bit Thumb STM instructions with writeback that specify \( R_n \) as the lowest register in the reglist are deprecated in ARMv6T2 and above.

--- Note ---

In addition, the PUSH and POP instructions are subsets of the STM and LDM instructions and can therefore be expressed using the STM and LDM instructions. Some forms of PUSH and POP are also 16-bit instructions.

--- Note ---

These 16-bit instructions are not available in ThumbEE.

**Loading to the PC**

A load to the PC causes a branch to the instruction at the address loaded.

In ARMv4, bits[1:0] of the address loaded must be 0b00.

In ARMv5T and above:

- bits[1:0] must not be 0b10
- if bit[0] is 1, execution continues in Thumb state
- if bit[0] is 0, execution continues in ARM state.

**Loading or storing the base register, with writeback**

In ARM or 16-bit Thumb instructions, if \( R_n \) is in reglist, and writeback is specified with the ! suffix:

- If the instruction is STM{addr_mode}{cond} and \( R_n \) is the lowest-numbered register in reglist, the initial value of \( R_n \) is stored. These instructions are deprecated in ARMv6T2 and above.
• Otherwise, the loaded or stored value of \( R_n \) cannot be relied upon, so these instructions are not permitted.

32-bit Thumb instructions are not permitted if \( R_n \) is in reglist, and writeback is specified with the \(!\) suffix.

**Examples**

```
LDM   r8,{r0,r2,r9} ; LDMIA is a synonym for LDM
STMDB r1!,{r3-r6,r11,r12}
```

**Incorrect examples**

```
STM   r5!,{r5,r4,r9} ; value stored for R5 UNKNOWN
LDMDA r2, {}          ; must be at least one register in list
```

**See also**

**Concepts**

*Using the Assembler:*

• *Stack implementation using LDM and STM on page 5-22.*

**Reference**

• *Memory access instructions on page 3-9*
• *PUSH and POP on page 3-33*
• *Condition codes on page 3-162.*
3.3.10 PUSH and POP

Push registers onto, and pop registers off a full descending stack.

Syntax

PUSH{cond}  reglist
POP{cond}  reglist

where:

cond is an optional condition code.
reglist is a non-empty list of registers, enclosed in braces. It can contain register ranges. It must be comma separated if it contains more than one register or register range.

Usage

PUSH is a synonym for STMDB sp!, reglist and POP is a synonym for LDMIA sp! reglist. PUSH and POP are the preferred mnemonics in these cases.

Note

LDM and LDMFD are synonyms of LDMIA. STMFD is a synonym of STMDB.

Registers are stored on the stack in numerical order, with the lowest numbered register at the lowest address.

POP, with reglist including the PC

This instruction causes a branch to the address popped off the stack into the PC. This is usually a return from a subroutine, where the LR was pushed onto the stack at the start of the subroutine.

In ARMv5T and above:
• bits[1:0] must not be 0b10
• if bit[0] is 1, execution continues in Thumb state
• if bit[0] is 0, execution continues in ARM state.

In ARMv4, bits[1:0] of the address loaded must be 0b00.

Thumb instructions

A subset of these instructions are available in the Thumb instruction set.

The following restrictions apply to the 16-bit instructions:
• For PUSH, reglist can only include the Lo registers and the LR
• For POP, reglist can only include the Lo registers and the PC.

The following restrictions apply to the 32-bit instructions:
• reglist must not include the SP
• For PUSH, reglist must not include the PC
• For POP, reglist can include either the LR or the PC, but not both.
Restrictions on reglist in ARM instructions

ARM PUSH instructions can have SP and PC in the reglist but these instructions that include SP or PC in the reglist are deprecated in ARMv6T2 and above.

ARM POP instructions cannot have SP but can have PC in the reglist. These instructions that include both PC and LR in the reglist are deprecated in ARMv6T2 and above.

Examples

PUSH {r0,r4-r7}
PUSH {r2,lr}
POP {r0,r10,pc} ; no 16-bit version available

- LDM and STM on page 3-30
- Condition codes on page 3-162.
3.3.11 RFE

Return From Exception.

Syntax

RFE{addr_mode}{cond} Rn{}!

where:

addr_mode is any one of the following:

IA Increment address After each transfer (Full Descending stack)
IB Increment address Before each transfer (ARM only)
DA Decrement address After each transfer (ARM only)
DB Decrement address Before each transfer.

If addr_mode is omitted, it defaults to Increment After.

cond is an optional condition code.

Note

cond is permitted only in Thumb code, using a preceding IT instruction. This is an unconditional instruction in ARM.

Rn specifies the base register. Rn must not be PC.

! is an optional suffix. If ! is present, the final address is written back into Rn.

Usage

You can use RFE to return from an exception if you previously saved the return state using the SRS instruction. Rn is usually the SP where the return state information was saved.

Operation

Loads the PC and the CPSR from the address contained in Rn, and the following address. Optionally updates Rn.

Notes

RFE writes an address to the PC. The alignment of this address must be correct for the instruction set in use after the exception return:

• For a return to ARM, the address written to the PC must be word-aligned.
• For a return to Thumb, the address written to the PC must be halfword-aligned.
• For a return to Jazelle®, there are no alignment restrictions on the address written to the PC.

The results of breaking these rules are UNPREDICTABLE. However, no special precautions are required in software, if the instructions are used to return after a valid exception entry mechanism.

Where addresses are not word-aligned, RFE ignores the least significant two bits of Rn.
The time order of the accesses to individual words of memory generated by RFE is not architecturally defined. Do not use this instruction on memory-mapped I/O locations where access order matters.

Do not use RFE in unprivileged software execution.

Do not use RFE in ThumbEE.

**Architectures**

This ARM instruction is available in ARMv6 and above.

This 32-bit Thumb instruction is available in ARMv6T2 and above, except the ARMv7-M architecture.

There is no 16-bit version of this instruction.

**Example**

```
RFE sp!
```

**See also**

**Concepts**

*Using the Assembler:*

- *Processor modes, and privileged and unprivileged software execution on page 3-5.*

**Reference**

- *SRS on page 3-37*
- *Condition codes on page 3-162.*
3.3.12 SRS

Store Return State onto a stack.

Syntax

\[ \text{SRS}\{\text{addr\_mode}\}\{\text{cond}\}\text{ sp}\{!\}, \#\text{modenum} \]
\[ \text{SRS}\{\text{addr\_mode}\}\{\text{cond}\}\#\text{modenum}\{!\} \quad \text{; This is a pre-UAL syntax} \]

where:

- \(\text{addr\_mode}\) is any one of the following:
  - IA: Increment address After each transfer
  - IB: Increment address Before each transfer (ARM only)
  - DA: Decrement address After each transfer (ARM only)
  - DB: Decrement address Before each transfer (Full Descending stack).

If \(\text{addr\_mode}\) is omitted, it defaults to Increment After. You can also use stack oriented addressing mode suffixes, for example, when implementing stacks.

- \(\text{cond}\) is an optional condition code.

- \(!\) is an optional suffix. If \(!\) is present, the final address is written back into the SP of the mode specified by \(\text{modenum}\).

- \(\text{modenum}\) specifies the number of the mode whose banked SP is used as the base register. You must use only the defined mode numbers.

Operation

SRS stores the LR and the SPSR of the current mode, at the address contained in SP of the mode specified by \(\text{modenum}\), and the following word respectively. Optionally updates SP of the mode specified by \(\text{modenum}\). This is compatible with the normal use of the STM instruction for stack accesses.

- \(\text{cond}\) is permitted only in Thumb code, using a preceding IT instruction. This is an unconditional instruction in ARM.

Usage

You can use SRS to store return state for an exception handler on a different stack from the one automatically selected.

Notes

Where addresses are not word-aligned, SRS ignores the least significant two bits of the specified address.

The time order of the accesses to individual words of memory generated by SRS is not architecturally defined. Do not use this instruction on memory-mapped I/O locations where access order matters.
Do not use SRS in User and System modes because these modes do not have a SPSR.

Do not use SRS in ThumbEE.

SRS is not permitted in a non-secure state if `modenum` specifies monitor mode.

**Architectures**

This ARM instruction is available in ARMv6 and above.

This 32-bit Thumb instruction is available in ARMv6T2 and above, except the ARMv7-M architecture.

There is no 16-bit version of this instruction.

**Example**

```
R13_usr EQU 16
SRSFD sp,#R13_usr
```

**See also**

**Concepts**

*Using the Assembler:*
- *Stack implementation using LDM and STM* on page 5-22
- *Processor modes, and privileged and unprivileged software execution* on page 3-5.

**Reference**

- *LDM and STM* on page 3-30

3.3.13 LDREX and STREX

Load and Store Register Exclusive.

Syntax

LDREX{cond} Rt, [Rn {, #offset}]
STREX{cond} Rd, Rt, [Rn {, #offset}]
LDREX{cond} Rt, [Rn]
STREX{cond} Rd, Rt, [Rn]
LDREXH{cond} Rt, [Rn]
STREXH{cond} Rd, Rt, [Rn]
LDREXD{cond} Rt, Rt2, [Rn]
STREXD{cond} Rd, Rt, Rt2, [Rn]

where:
cond is an optional condition code.
Rd is the destination register for the returned status.
Rt is the register to load or store.
Rt2 is the second register for doubleword loads or stores.
Rn is the register on which the memory address is based.
offset is an optional offset applied to the value in Rn. offset is permitted only in 32-bit Thumb instructions. If offset is omitted, an offset of 0 is assumed.

LDREX

LDREX loads data from memory.

• If the physical address has the Shared TLB attribute, LDREX tags the physical address as exclusive access for the current processor, and clears any exclusive access tag for this processor for any other physical address.

• Otherwise, it tags the fact that the executing processor has an outstanding tagged physical address.

STREX

STREX performs a conditional store to memory. The conditions are as follows:

• If the physical address does not have the Shared TLB attribute, and the executing processor has an outstanding tagged physical address, the store takes place, the tag is cleared, and the value 0 is returned in Rd.

• If the physical address does not have the Shared TLB attribute, and the executing processor does not have an outstanding tagged physical address, the store does not take place, and the value 1 is returned in Rd.

• If the physical address has the Shared TLB attribute, and the physical address is tagged as exclusive access for the executing processor, the store takes place, the tag is cleared, and the value 0 is returned in Rd.
• If the physical address has the Shared TLB attribute, and the physical address is not tagged as exclusive access for the executing processor, the store does not take place, and the value 1 is returned in Rd.

Restrictions

PC must not be used for any of Rd, Rt, Rt2, or Rn.

For STREX, Rd must not be the same register as Rt, Rt2, or Rn.

For ARM instructions:
• SP can be used but use of SP for any of Rd, Rt, or Rt2 is deprecated in ARMv6T2 and above
• For LDREX0 and STREX0, Rt must be an even numbered register, and not LR
• Rt2 must be R(t+1)
• offset is not permitted.

For Thumb instructions:
• SP can be used for Rn, but must not be used for any of Rd, Rt, or Rt2
• for LDREX0, Rt and Rt2 must not be the same register
• the value of offset can be any multiple of four in the range 0-1020.

Usage

Use LDREX and STREX to implement interprocess communication in multiple-processor and shared-memory systems.

For reasons of performance, keep the number of instructions between corresponding LDREX and STREX instruction to a minimum.

Note

The address used in a STREX instruction must be the same as the address in the most recently executed LDREX instruction. The result of executing a STREX instruction to a different address is UNPREDICTABLE.

Architectures

ARM LDREX and STREX are available in ARMv6 and above.

ARM LDREXB, LDREXH, LDREXD, STREXB, STREXH, and STREXH are available in ARMv6K and above.

All these 32-bit Thumb instructions are available in ARMv6T2 and above, except that LDREXD and STREXD are not available in the ARMv7-M architecture.

There are no 16-bit versions of these instructions.

Examples

```assembly
MOV r1, #0x1                ; load the ‘lock taken’ value
try
    LDREX r0, [LockAddr]  ; load the lock value
    CMP r0, #0           ; is the lock free?
    STREXEQ r0, r1, [LockAddr] ; try and claim the lock
    CMP EQ r0, #0       ; did this succeed?
    BNE try            ; no – try again
    ...               ; yes – we have the lock
```
See also

Reference
- Memory access instructions on page 3-9
- Condition codes on page 3-162.
3.3.14 CLREX

Clear Exclusive. Clears the local record of the executing processor that an address has had a request for an exclusive access.

Syntax

CLREX{cond}

where:

cond is an optional condition code.

--- Note ---
cond is permitted only in Thumb code, using a preceding IT instruction. This is an unconditional instruction in ARM.

Usage

Use the CLREX instruction to return a closely-coupled exclusive access monitor to its open-access state. This removes the requirement for a dummy store to memory.

It is implementation defined whether CLREX also clears the global record of the executing processor that an address has had a request for an exclusive access.

Architectures

This ARM instruction is available in ARMv6K and above.

This 32-bit Thumb instruction is available in ARMv7 and above.

There is no 16-bit Thumb CLREX instruction.

See also

Reference

- Memory access instructions on page 3-9
- Condition codes on page 3-162
### 3.3.15 SWP and SWPB

Swap data between registers and memory.

**Syntax**

\[ \text{SWP}\{B\}\{\text{cond}\} \ Rt, \ Rt2, [\text{Rn}] \]

where:

- **cond** is an optional condition code.
- **B** is an optional suffix. If B is present, a byte is swapped. Otherwise, a 32-bit word is swapped.
- **Rt** is the destination register. Rt must not be PC.
- **Rt2** is the source register. Rt2 can be the same register as Rt. Rt2 must not be PC.
- **Rn** contains the address in memory. Rn must be a different register from both Rt and Rt2. Rn must not be PC.

**Usage**

You can use SWP and SWPB to implement semaphores:

- Data from memory is loaded into Rt.
- The contents of Rt2 is saved to memory.
- If Rt2 is the same register as Rt, the contents of the register is swapped with the contents of the memory location.

**Note**

The use of SWP and SWPB is deprecated in ARMv6 and above. You can use LDREX and STREX instructions to implement more sophisticated semaphores in ARMv6 and above.

**Architectures**

These ARM instructions are available in all versions of the ARM architecture.

There are no Thumb SWP or SWPB instructions.

**See also**

3.4 General data processing instructions

This section contains the following subsections:

- Flexible second operand (Operand2) on page 3-45
- Operand2 as a constant on page 3-45
- Operand2 as a register with optional shift on page 3-46
- Shift operations on page 3-46
- ADD, SUB, RSB, ADC, SBC, and RSC on page 3-50
  Add, Subtract, and Reverse Subtract, each with or without Carry.
- SUBS pc, lr on page 3-54
  Return from exception without popping the stack.
- AND, ORR, EOR, BIC, and ORN on page 3-56
  Logical AND, OR, Exclusive OR, OR NOT, and Bit Clear.
- CLZ on page 3-58
  Count Leading Zeros.
- CMP and CMN on page 3-59
  Compare and Compare Negative.
- MOV and MVN on page 3-61
  Move and Move Not.
- MOVT on page 3-64
  Move Top, Wide.
- TST and TEQ on page 3-65
  Test and Test Equivalence.
- SEL on page 3-67
  Select bytes from each operand according to the state of the APSR GE flags.
- REV, REV16, REVSH, and RBIT on page 3-69
  Reverse bytes or Bits.
- ASR, LSL, LSR, ROR, and RRX on page 3-71
  Arithmetic Shift Right.
- SDIV and UDIV on page 3-74
  Signed Divide and Unsigned Divide.
### 3.4.1 Flexible second operand (Operand2)

Many ARM and Thumb general data processing instructions have a flexible second operand. This is shown as *Operand2* in the descriptions of the syntax of each instruction.

*Operand2* can be a:
- constant
- register with optional shift.

### 3.4.2 Operand2 as a constant

You specify an Operand2 constant in the form:

```
#constant
```

where *constant* is an expression evaluating to a numeric value.

In ARM instructions, *constant* can have any value that can be produced by rotating an 8-bit value right by any even number of bits within a 32-bit word.

In Thumb instructions, *constant* can be:
- any constant that can be produced by shifting an 8-bit value left by any number of bits within a 32-bit word
- any constant of the form `0x00XY00XY`
- any constant of the form `0xXY00XY00`
- any constant of the form `0xXYXYXYXY`.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the constants shown above, X and Y are hexadecimal digits.</td>
</tr>
</tbody>
</table>

In addition, in a small number of instructions, *constant* can take a wider range of values. These are detailed in the individual instruction descriptions.

When an Operand2 constant is used with the instructions `MOV, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST`, the carry flag is updated to bit[31] of the constant, if the constant is greater than 255 and can be produced by shifting an 8-bit value. These instructions do not affect the carry flag if Operand2 is any other constant.

**Instruction substitution**

If a value of *constant* is not available, but its logical inverse or negation is available, then the assembler produces an equivalent instruction and inverts or negates `constant`.

For example, an assembler might assemble the instruction `CMP Rd, #0xFFFFFFFE` as the equivalent instruction `CMN Rd, #0x2`.

Be aware of this when comparing disassembly listings with source code.

You can use the `--diag_warning 1645` assembler command line option to check when an instruction substitution occurs.
3.4.3 Operand2 as a register with optional shift

You specify an Operand2 register in the form:

\[
Rm \{, \ shift\}
\]

where:

- \(Rm\) is the register holding the data for the second operand.
- \(shift\) is an optional constant or register-controlled shift to be applied to \(Rm\). It can be one of:
  - \(ASR \ #n\) arithmetic shift right \(n\) bits, \(1 \leq n \leq 32\).
  - \(LSL \ #n\) logical shift left \(n\) bits, \(1 \leq n \leq 31\).
  - \(LSR \ #n\) logical shift right \(n\) bits, \(1 \leq n \leq 32\).
  - \(ROR \ #n\) rotate right \(n\) bits, \(1 \leq n \leq 31\).
  - \(RRX\) rotate right one bit, with extend.

\(type\ \ Rs\) register-controlled shift is available in ARM code only, where:
- \(type\) is one of \(ASR\), \(LSL\), \(LSR\), \(ROR\).
- \(Rs\) is a register supplying the shift amount, and only the least significant byte is used.
- if omitted, no shift occurs, equivalent to \(LSL \ #0\).

If you omit the shift, or specify \(LSL \ #0\), the instruction uses the value in \(Rm\).

If you specify a shift, the shift is applied to the value in \(Rm\), and the resulting 32-bit value is used by the instruction. However, the contents in the register \(Rm\) remains unchanged. Specifying a register with shift also updates the carry flag when used with certain instructions.

3.4.4 Shift operations

Register shift operations move the bits in a register left or right by a specified number of bits, the \textit{shift length}. Register shift can be performed:

- directly by the instructions \(ASR\), \(LSR\), \(LSL\), \(ROR\), and \(RRX\), and the result is written to a destination register
- during the calculation of \(\text{Operand2}\) by the instructions that specify the second operand as a register with shift. The result is used by the instruction.

The permitted shift lengths depend on the shift type and the instruction, see the individual instruction description or the flexible second operand description. If the shift length is 0, no shift occurs. Register shift operations update the carry flag except when the specified shift length is 0. The following sub-sections describe the various shift operations and how they affect the carry flag. In these descriptions, \(Rm\) is the register containing the value to be shifted, and \(n\) is the shift length.

**ASR**

Arithmetic shift right by \(n\) bits moves the left-hand 32-\(n\) bits of the register \(Rm\), to the right by \(n\) places, into the right-hand 32-\(n\) bits of the result. And it copies the original bit[31] of the register into the left-hand \(n\) bits of the result. See Figure 3-1 on page 3-47.

You can use the \(ASR \ #n\) operation to divide the value in the register \(Rm\) by \(2^n\), with the result being rounded towards negative-infinity.
When the instruction is ASRS or when ASR #n is used in Operand2 with the instructions MOVS, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST, the carry flag is updated to the last bit shifted out, bit\[n-1\], of the register \(Rm\).

--- Note ---
- If \(n\) is 32 or more, then all the bits in the result are set to the value of bit[31] of \(Rm\).
- If \(n\) is 32 or more and the carry flag is updated, it is updated to the value of bit[31] of \(Rm\).

---

**LSR**

Logical shift right by \(n\) bits moves the left-hand 32-\(n\) bits of the register \(Rm\), to the right by \(n\) places, into the right-hand 32-\(n\) bits of the result. And it sets the left-hand \(n\) bits of the result to 0. See Figure 3-2.

You can use the LSR \(#n\) operation to divide the value in the register \(Rm\) by \(2^n\), if the value is regarded as an unsigned integer.

When the instruction is LSRS or when LSR \(#n\) is used in Operand2 with the instructions MOVS, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST, the carry flag is updated to the last bit shifted out, bit\[n-1\], of the register \(Rm\).

--- Note ---
- If \(n\) is 32 or more, then all the bits in the result are cleared to 0.
- If \(n\) is 33 or more and the carry flag is updated, it is updated to 0.

---

**LSL**

Logical shift left by \(n\) bits moves the right-hand 32-\(n\) bits of the register \(Rm\), to the left by \(n\) places, into the left-hand 32-\(n\) bits of the result. And it sets the right-hand \(n\) bits of the result to 0. See Figure 3-3 on page 3-48.

You can use the LSL \(#n\) operation to multiply the value in the register \(Rm\) by \(2^n\), if the value is regarded as an unsigned integer or a two’s complement signed integer. Overflow can occur without warning.
When the instruction is LSLS or when LSL\_\_\_\_\_n, with non-zero \_\_\_\_\_n, is used inOperand2 with the instructions MOVS, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST, the carry flag is updated to the last bit shifted out, bit[32-\_\_\_\_\_n], of the register \_\_\_\_\_Rm. These instructions do not affect the carry flag when used with LSL\_\_\_\_\_#0.

--- **Note** ---

- If \_\_\_\_\_n is 32 or more, then all the bits in the result are cleared to 0.
- If \_\_\_\_\_n is 33 or more and the carry flag is updated, it is updated to 0.

---

**Figure 3-3 LSL #3**

**ROR**

Rotate right by \_\_\_\_\_n bits moves the left-hand 32-\_\_\_\_\_n bits of the register \_\_\_\_\_Rm, to the right by \_\_\_\_\_n places, into the right-hand 32-\_\_\_\_\_n bits of the result. And it moves the right-hand \_\_\_\_\_n bits of the register into the left-hand \_\_\_\_\_n bits of the result. See **Figure 3-4**.

When the instruction is RORS or when ROR\_\_\_\_\_n is used inOperand2 with the instructions MOVS, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST, the carry flag is updated to the last bit rotation, bit[\_\_\_\_\_n-1], of the register \_\_\_\_\_Rm.

--- **Note** ---

- If \_\_\_\_\_n is 32, then the value of the result is same as the value in \_\_\_\_\_Rm, and if the carry flag is updated, it is updated to bit[31] of \_\_\_\_\_Rm.
- ROR with shift length, \_\_\_\_\_n, more than 32 is the same as ROR with shift length n-32.

---

**Figure 3-4 ROR #3**

**RRX**

Rotate right with extend moves the bits of the register \_\_\_\_\_Rm to the right by one bit. And it copies the carry flag into bit[31] of the result. See **Figure 3-5 on page 3-49**.

When the instruction is RRXS or when RRX is used inOperand2 with the instructions MOVS, MVNS, ANDS, ORRS, ORNS, EORS, BICS, TEQ or TST, the carry flag is updated to bit[0] of the register \_\_\_\_\_Rm.

Concepts

• Flexible second operand (Operand2) on page 3-45.
3.4.5 ADD, SUB, RSB, ADC, SBC, and RSC

Add, Subtract, and Reverse Subtract, each with or without Carry.

Syntax

\[
\text{op}\{\text{cond}\} \{\text{opdr}\}, \text{Rn}, \text{Operand2}
\]

\[
\text{op}\{\text{cond}\} \{\text{opdr}\}, \text{Rn}, #\text{imm12} \quad ; \text{32-bit Thumb ADD and SUB only}
\]

where:

- \(\text{op}\) is one of:
  - ADD: Add.
  - ADC: Add with Carry.
  - SUB: Subtract.
  - RSB: Reverse Subtract.
  - SBC: Subtract with Carry.
  - RSC: Reverse Subtract with Carry (ARM only).

- \(S\) is an optional suffix. If \(S\) is specified, the condition code flags are updated on the result of the operation.

- \(\text{cond}\) is an optional condition code.

- \(\text{Rd}\) is the destination register.

- \(\text{Rn}\) is the register holding the first operand.

- \(\text{Operand2}\) is a flexible second operand.

- \(\text{imm12}\) is any value in the range 0-4095.

Usage

The ADD instruction adds the values in \(\text{Rn}\) and \(\text{Operand2}\) or \(\text{imm12}\).

The SUB instruction subtracts the value of \(\text{Operand2}\) or \(\text{imm12}\) from the value in \(\text{Rn}\).

The RSB (Reverse Subtract) instruction subtracts the value in \(\text{Rn}\) from the value of \(\text{Operand2}\). This is useful because of the wide range of options for \(\text{Operand2}\).

You can use ADC, SBC, and RSC to synthesize multiword arithmetic.

The ADC (Add with Carry) instruction adds the values in \(\text{Rn}\) and \(\text{Operand2}\), together with the carry flag.

The SBC (Subtract with Carry) instruction subtracts the value of \(\text{Operand2}\) from the value in \(\text{Rn}\). If the carry flag is clear, the result is reduced by one.

The RSC (Reverse Subtract with Carry) instruction subtracts the value in \(\text{Rn}\) from the value of \(\text{Operand2}\). If the carry flag is clear, the result is reduced by one.

In certain circumstances, the assembler can substitute one instruction for another. Be aware of this when reading disassembly listings.

Use of PC and SP in Thumb instructions

In most of these instructions, you cannot use PC (R15) for \(\text{Rd}\), or any operand.
The exceptions are:

- you can use PC for \( R_n \) in 32-bit Thumb ADD and SUB instructions, with a constant \( \text{Operand2} \) value in the range 0-4095, and no S suffix. These instructions are useful for generating PC-relative addresses. Bit[1] of the PC value reads as 0 in this case, so that the base address for the calculation is always word-aligned.

- you can use PC in 16-bit Thumb ADD\{cond\} \( R_d, R_d, R_m \) instructions, where both registers cannot be PC. However, the following 16-bit Thumb instructions are deprecated in ARMv6T2 and above:
  
  - ADD\{cond\} PC, SP, PC
  - ADD\{cond\} SP, SP, PC.

In most of these instructions, you cannot use SP (R13) for \( Rd \), or any operand. Except that:

- You can use SP for \( R_n \) in ADD and SUB instructions
- ADD\{cond\} SP, SP, SP is permitted but is deprecated in ARMv6T2 and above
- ADD\{S\}\{cond\} SP, SP, Rm{,shift} and SUB\{S\}\{cond\} SP, SP, Rm{,shift} are permitted if \( shift \) is omitted or LSL #1, LSL #2, or LSL #3.

**Use of PC and SP in ARM instructions**

You cannot use PC for \( Rd \) or any operand in any data processing instruction that has a register-controlled shift.

With the exception of ADD and SUB, use of PC for any operand, in instructions without register-controlled shift, is deprecated.

In SUB instructions without register-controlled shift, use of PC is deprecated except for the following cases:

- Use of PC for \( Rd \)
- Use of PC for \( R_n \) in the instruction SUB\{cond\} \( R_d, R_n, \#\text{Constant} \).

In ADD instructions without register-controlled shift, use of PC is deprecated except for the following cases:

- Use of PC for \( Rd \) in instructions that do not add SP to a register
- Use of PC for \( R_n \) and use of PC for \( R_m \) in instructions that add two registers other than SP
- Use of PC for \( R_n \) in the instruction ADD\{cond\} \( R_d, R_n, \#\text{Constant} \).

If you use PC (R15) as \( R_n \) or \( R_m \), the value used is the address of the instruction plus 8.

If you use PC as \( Rd \):

- Execution branches to the address corresponding to the result.
- If you use the S suffix, see the SUBS pc, lr instruction.

You can use SP for \( R_n \) in ADD and SUB instructions, however, ADDS PC, SP, \#Constant and SUBS PC, SP, \#Constant are deprecated.

You can use SP in ADD (register) and SUB (register) if \( R_n \) is SP and \( shift \) is omitted or LSL #1, LSL #2, or LSL #3.

Other uses of SP in these ARM instructions are deprecated.

**Note**

The deprecation of SP and PC in ARM instructions is only in ARMv6T2 and above.
Condition flags

If $S$ is specified, these instructions update the N, Z, C and V flags according to the result.

16-bit instructions

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- **ADD $Rd$, $Rn$, $#imm**  
  imm range 0-7. $Rd$ and $Rn$ must both be Lo registers.

- **ADD $Rd$, $Rn$, $Rm**  
  $Rd$, $Rn$ and $Rm$ must all be Lo registers.

- **ADD $Rd$, $Rd$, $Rm**  
  ARMv6 and earlier: either $Rd$ or $Rm$, or both, must be a Hi register.  
  ARMv6T2 and above: this restriction does not apply.

- **ADD $Rd$, $Rd$, $#imm**  
  imm range 0-255. $Rd$ must be a Lo register.

- **ADDS $Rd$, $Rn$, $Rm$**  
  $Rd$, $Rn$ and $Rm$ must all be Lo registers.

- **ADCS $Rd$, $Rn$, $Rm$**  
  imm range 0-508, word aligned.

- **ADDC $Rd$, $SP$, $#imm**  
  imm range 0-1020, word aligned. $Rd$ must be a Lo register.  
  Bits[1:0] of the PC are read as 0 in this instruction.

- **SUB $Rd$, $Rn$, $Rm$**  
  $Rd$, $Rn$ and $Rm$ must all be Lo registers.

- **SUB $Rd$, $Rn$, $#imm**  
  imm range 0-7. $Rd$ and $Rn$ both Lo registers.

- **SUBS $Rd$, $Rn$, $#imm**  
  imm range 0-255. $Rd$ must be a Lo register.

- **SUBS $Rd$, $Rd$, $#imm**  
  imm range 0-255. $Rd$ must be a Lo register.

- **SBCS $Rd$, $Rn$, $Rm$**  
  $Rd$, $Rn$ and $Rm$ must all be Lo registers.

- **SUB $SP$, $SP$, $#imm**  
  imm range 0-508, word aligned.

- **RSBS $Rd$, $Rn$, #0**  
  $Rd$ and $Rn$ both Lo registers.

Examples

- **ADD r2, r1, r3**  
  ; sets the flags on the result

- **SUBS r8, r6, #240**  
  ; subtracts contents of R4 from 1280

- **RSB r4, r4, #1280**  
  ; only executed if C flag set and Z
  ; flag clear

- **ADCHI r11, r0, r3**  
  ; conditional, flags set

- **RSCSLE r0,r5,r0,LSL r4**  
  ; PC not permitted with register
  ; controlled shift

Incorrect example

- **RSCSLE r0,pc,r0,LSL r4**  
  ; PC not permitted with register
  ; controlled shift

Multiword arithmetic examples

These two instructions add a 64-bit integer contained in R2 and R3 to another 64-bit integer contained in R0 and R1, and place the result in R4 and R5.

- **ADD S r4, r0, r2**  
  ; adding the least significant words

- **ADC r5, r1, r3**  
  ; adding the most significant words

These instructions subtract one 96-bit integer from another:
For clarity, the above examples use consecutive registers for multiword values. There is no requirement to do this. The following, for example, is perfectly valid:

```assembly
SUBS r6, r6, r9
SBCS r9, r2, r1
SBC r2, r8, r11
```

**See also**

### 3.4.6 SUBS pc, lr

Exception return, without popping anything from the stack.

#### Syntax

- `SUBS{cond} pc, lr, #imm` ; ARM and Thumb code
- `MOVS{cond} pc, lr` ; ARM and Thumb code
- `op1S{cond} pc, Rn, #imm` ; ARM code only and is deprecated
- `op1S{cond} pc, Rn, Rm {, shift}` ; ARM code only and is deprecated
- `op2S{cond} pc, #imm` ; ARM code only and is deprecated
- `op2S{cond} pc, Rm {, shift}` ; ARM code only and is deprecated

where:

- `op1` is one of ADC, ADD, AND, BIC, EOR, ORN, ORR, RSB, RSC, SBC, and SUB.
- `op2` is one of MOV and MVN.
- `cond` is an optional condition code.
- `imm` is an immediate value. In Thumb code, it is limited to the range 0-255. In ARM code, it is a flexible second operand.
- `Rn` is the first operand register. ARM deprecates the use of any register except LR.
- `Rm` is the optionally shifted second or only operand register.
- `shift` is an optional condition code.

#### Usage

`SUBS pc, lr, #imm` subtracts a value from the link register and loads the PC with the result, then copies the SPSR to the CPSR.

You can use `SUBS pc, lr, #imm` to return from an exception if there is no return state on the stack. The value of `#imm` depends on the exception to return from.

#### Notes

- `SUBS pc, lr, #imm` writes an address to the PC. The alignment of this address must be correct for the instruction set in use after the exception return:
  - For a return to ARM, the address written to the PC must be word-aligned.
  - For a return to Thumb, the address written to the PC must be halfword-aligned.
  - For a return to Jazelle, there are no alignment restrictions on the address written to the PC.

The results of breaking these rules are UNPREDICTABLE. However, no special precautions are required in software, if the instructions are used to return after a valid exception entry mechanism.

In Thumb, only `SUBS{cond} pc, lr, #imm` is a valid instruction. `MOVS pc, lr` is a synonym of `SUBS pc, lr, #0`. Other instructions are undefined.

In ARM, only `SUBS{cond} pc, lr, #imm` and `MOVS{cond} pc, lr` are valid instructions. Other instructions are deprecated in ARMv6T2 and above.
--- Caution ---
Do not use these instructions in User mode or System mode. The effect of such an instruction is UNPREDICTABLE, but the assembler cannot warn you at assembly time.

Architectures

This ARM instruction is available in all versions of the ARM architecture.

This 32-bit Thumb instruction is available in ARMv6T2 and above, except the ARMv7-M architecture.

There is no 16-bit Thumb version of this instruction.

• Condition codes on page 3-162.
3.4.7 AND, ORR, EOR, BIC, and ORN

Logical AND, OR, Exclusive OR, Bit Clear, and OR NOT.

Syntax

\[ \text{op}\{S\}\{\text{cond}\} \, R_d, \, R_n, \, \text{Operand2} \]

where:

- \( \text{op} \) is one of:
  - \( \text{AND} \) logical AND.
  - \( \text{ORR} \) logical OR.
  - \( \text{EOR} \) logical Exclusive OR.
  - \( \text{BIC} \) logical AND NOT.
  - \( \text{ORN} \) logical OR NOT (Thumb only).

- \( S \) is an optional suffix. If \( S \) is specified, the condition code flags are updated on the result of the operation.

- \( \text{cond} \) is an optional condition code.

- \( R_d \) is the destination register.

- \( R_n \) is the register holding the first operand.

- \( \text{Operand2} \) is a flexible second operand.

Usage

The \( \text{AND} \), \( \text{EOR} \), and \( \text{ORR} \) instructions perform bitwise AND, Exclusive OR, and OR operations on the values in \( R_n \) and \( \text{Operand2} \).

The \( \text{BIC} \) (Bit Clear) instruction performs an AND operation on the bits in \( R_n \) with the complements of the corresponding bits in the value of \( \text{Operand2} \).

The \( \text{ORN} \) Thumb instruction performs an OR operation on the bits in \( R_n \) with the complements of the corresponding bits in the value of \( \text{Operand2} \).

In certain circumstances, the assembler can substitute \( \text{BIC} \) for \( \text{AND} \), \( \text{AND} \) for \( \text{BIC} \), \( \text{ORN} \) for \( \text{ORR} \), or \( \text{ORR} \) for \( \text{ORN} \). Be aware of this when reading disassembly listings.

Use of PC in 32-bit Thumb instructions

You cannot use PC (R15) for \( R_d \) or any operand in any of these instructions.

Use of PC and SP in ARM instructions

You can use PC and SP in these ARM instructions but they are deprecated in ARMv6T2 and above.

If you use PC as \( R_n \), the value used is the address of the instruction plus 8.

If you use PC as \( R_d \):
- Execution branches to the address corresponding to the result.
- If you use the \( S \) suffix, see the \( \text{SUBS} \, pc, lr \) instruction.

You cannot use PC for any operand in any data processing instruction that has a register-controlled shift.
**Condition flags**

If $S$ is specified, these instructions:
- update the N and Z flags according to the result
- can update the C flag during the calculation of $\textit{Operand2}$
- do not affect the V flag.

**16-bit instructions**

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- **ANDS** $\textit{Rd}, \textit{Rd}, \textit{Rm}$
  - $\textit{Rd}$ and $\textit{Rm}$ must both be Lo registers.
- **EORS** $\textit{Rd}, \textit{Rd}, \textit{Rm}$
  - $\textit{Rd}$ and $\textit{Rm}$ must both be Lo registers.
- **ORRS** $\textit{Rd}, \textit{Rd}, \textit{Rm}$
  - $\textit{Rd}$ and $\textit{Rm}$ must both be Lo registers.
- **BICS** $\textit{Rd}, \textit{Rd}, \textit{Rm}$
  - $\textit{Rd}$ and $\textit{Rm}$ must both be Lo registers.

In the first three cases, it does not matter if you specify $\textit{OP} \ S \textit{Rd}, \textit{Rm}, \textit{Rd}$. The instruction is the same.

**Examples**

- `AND     r9,r2,#0xFF00`
- `ORREQ   r2, r0, r5`
- `EORS    r0, r0, r3, ROR r6`
- `ANDS   r9, r8, #0x19`
- `EORS   r7, r11, #0x18181818`
- `BIC     r0, r1, #0xab`
- `ORN    r7, r11, lr, ROR #4`
- `ORNS   r7, r11, lr, ASR #32`

**Incorrect example**

- `EORS    r0, pc, r3, ROR r6` ; PC not permitted with register
  - controlled shift

**See also**

- **Flexible second operand (Operand2) on page 3-45**
- **Instruction substitution on page 3-45.**

**Developing Software for ARM Processors:**

- **Chapter 6 Handling Processor Exceptions.**

**Reference**

- **SUBS pc, lr on page 3-54**
- **Condition codes on page 3-162.**
3.4.8 CLZ

Count Leading Zeros.

**Syntax**

\[
\text{CLZ}\{\text{cond}\} \ Rd, \ Rm
\]

where:

- \textit{cond} is an optional condition code.
- \textit{Rd} is the destination register.
- \textit{Rm} is the operand register.

**Usage**

The CLZ instruction counts the number of leading zeros in the value in \textit{Rm} and returns the result in \textit{Rd}. The result value is 32 if no bits are set in the source register, and zero if bit 31 is set.

**Register restrictions**

You cannot use PC for any operand.

You can use SP in these ARM instructions but this is deprecated in ARMv6T2 and above.

You cannot use SP in Thumb instructions.

**Condition flags**

This instruction does not change the flags.

**Architectures**

This ARM instruction is available in ARMv5T and above.

This 32-bit Thumb instruction is available in ARMv6T2 and above.

There is no 16-bit Thumb version of this instruction.

**Examples**

\[
\begin{align*}
\text{CLZ} & \ r4, r9 \\
\text{CLZNE} & \ r2, r3
\end{align*}
\]

Use the CLZ Thumb instruction followed by a left shift of \textit{Rm} by the resulting \textit{Rd} value to normalize the value of register \textit{Rm}. Use MOVS, rather than MOV, to flag the case where \textit{Rm} is zero:

\[
\begin{align*}
\text{CLZ} & \ r5, r9 \\
\text{MOVS} & \ r9, r9, \text{LSL} \ r5
\end{align*}
\]

**See also**

Reference

- *Condition codes* on page 3-162.
3.4.9 CMP and CMN

Compare and Compare Negative.

Syntax

\[
\text{CMP \{cond\} } Rn, \text{ Operand2} \\
\text{CMN \{cond\} } Rn, \text{ Operand2}
\]

where:

- \text{cond} is an optional condition code.
- \text{Rn} is the ARM register holding the first operand.
- \text{Operand2} is a flexible second operand.

Usage

These instructions compare the value in a register with \text{Operand2}. They update the condition flags on the result, but do not place the result in any register.

The \text{CMP} instruction subtracts the value of \text{Operand2} from the value in \text{Rn}. This is the same as a \text{SUBS} instruction, except that the result is discarded.

The \text{CMN} instruction adds the value of \text{Operand2} to the value in \text{Rn}. This is the same as an \text{ADDS} instruction, except that the result is discarded.

In certain circumstances, the assembler can substitute \text{CMN} for \text{CMP}, or \text{CMP} for \text{CMN}. Be aware of this when reading disassembly listings.

Use of PC in ARM and Thumb instructions

You cannot use PC for any operand in any data processing instruction that has a register-controlled shift.

You can use PC (R15) in these ARM instructions without register controlled shift but this is deprecated in ARMv6T2 and above.

If you use PC as \text{Rn} in ARM instructions, the value used is the address of the instruction plus 8.

You cannot use PC for any operand in these Thumb instructions.

Use of SP in ARM and Thumb instructions

You can use SP for \text{Rn} in ARM and Thumb instructions.

You can use SP for \text{Rm} in ARM instructions but this is deprecated in ARMv6T2 and above.

You can use SP for \text{Rm} in a 16-bit Thumb \text{CMP Rn, Rm} instruction but this is deprecated in ARMv6T2 and above. Other use of SP for \text{Rm} is not permitted in Thumb.

Condition flags

These instructions update the N, Z, C and V flags according to the result.
16-bit instructions

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- **CMP Rn, Rm**  
  Lo register restriction does not apply.

- **CMN Rn, Rm**  
  Rn and Rm must both be Lo registers.

- **CMP Rn, #imm**  
  Rn must be a Lo register. imm range 0-255.

Examples

- `CMP r2, r9`
- `CMN r0, #6400`
- `CMPGT sp, r7, LSL #2`

Incorrect example

- `CMP r2, pc, ASR r0 ; PC not permitted with register-controlled shift`

See also

- *Flexible second operand (Operand2)* on page 3-45
- *Instruction substitution* on page 3-45.

Reference

- *Condition codes* on page 3-162.
3.4.10 MOV and MVN

Move and Move Not.

Syntax

\[
\begin{align*}
\text{MOV}\{S\}\{\text{cond}\} & \ R_d, \ \text{Operand2} \\
\text{MOV}\{\text{cond}\} & \ R_d, \ #\text{imm16} \\
\text{MVN}\{S\}\{\text{cond}\} & \ R_d, \ \text{Operand2}
\end{align*}
\]

where:

- \(S\) is an optional suffix. If \(S\) is specified, the condition code flags are updated on the result of the operation.
- \(\text{cond}\) is an optional condition code.
- \(R_d\) is the destination register.
- \(\text{Operand2}\) is a flexible second operand.
- \(\text{imm16}\) is any value in the range 0-65535.

Usage

The MOV instruction copies the value of \(\text{Operand2}\) into \(R_d\).

The MVN instruction takes the value of \(\text{Operand2}\), performs a bitwise logical NOT operation on the value, and places the result into \(R_d\).

In certain circumstances, the assembler can substitute MVN for MOV, or MOV for MVN. Be aware of this when reading disassembly listings.

Use of PC and SP in 32-bit Thumb MOV and MVN

You cannot use PC (R15) for \(R_d\), or in \(\text{Operand2}\), in 32-bit Thumb MOV or MVN instructions. With the following exceptions, you cannot use SP (R13) for \(R_d\), or in \(\text{Operand2}\):

- \(\text{MOV}\{\text{cond}\}.W\ \ R_d, \ \ SP\)
- \(\text{MOV}\{\text{cond}\}.W\ \ SP, \ \ R_m\)

Use of PC and SP in 16-bit Thumb

You can use PC or SP in 16-bit Thumb MOV\{\text{cond}\} Rd, rm instructions but these instructions in which both \(R_d\) and \(R_m\) are SP or PC are deprecated in ARMv6T2 and above.

You cannot use PC or SP in any other MOV\{S\} or MVN\{S\} 16-bit Thumb instructions.

Use of PC and SP in ARM MOV and MVN

You cannot use PC for \(R_d\) or any operand in any data processing instruction that has a register-controlled shift.

In instructions without register-controlled shift, use of PC is deprecated except the following cases:

- \(\text{MOVS\ PC,\ LR}\)
- \(\text{MOV\ PC,\ R_m\ when\ R_m\ is\ not\ PC\ or\ SP}\)
- \(\text{MOV\ R_d,\ PC\ when\ R_d\ is\ not\ PC\ or\ SP}\).
You can use SP for Rd or Rm. But these are deprecated except the following cases:

- MOV SP, Rm when Rm is not PC or SP
- MOV Rd, SP when Rd is not PC or SP.

--- Note ---
- You cannot use PC for Rd in MOV Rd, #imm16 if the #imm16 value is not a permitted Operand2 value. You can use PC in forms with Operand2 without register-controlled shift.
- The deprecation of PC and SP in ARM instructions only apply to ARMv6T2 and above.

If you use PC as Rm, the value used is the address of the instruction plus 8.

If you use PC as Rd:
- Execution branches to the address corresponding to the result.
- If you use the S suffix, see the SUBS pc,lr instruction.

**Condition flags**

If S is specified, these instructions:
- update the N and Z flags according to the result
- can update the C flag during the calculation of Operand2
- do not affect the V flag.

**16-bit instructions**

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- MOV Rm, #imm
  - Rd must be a Lo register. imm range 0-255.
- MOV Rm, Rm
  - Rd and Rm must both be Lo registers.
- MOV Rd, Rm
  - In architectures before ARMv6, either Rd or Rm, or both, must be a Hi register. In ARMv6 and above, this restriction does not apply.

**Architectures**

The #imm16 form of the ARM instruction is available in ARMv6T2 and above. The other forms of the ARM instruction are available in all versions of the ARM architecture.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

These 16-bit Thumb instructions are available in all T variants of the ARM architecture.

**Example**

- MVNNE r11, #0xF000000B ; ARM only. This immediate value is not available in T2.

**Incorrect example**

- MVN pc,r3,ASR r0 ; PC not permitted with register-controlled shift
See also

Concepts
- Flexible second operand (Operand2) on page 3-45
- Instruction substitution on page 3-45.

Developing Software for ARM Processors:
- Chapter 6 Handling Processor Exceptions.

Reference
- Condition codes on page 3-162
- SUBS pc, lr on page 3-54.
3.4.11 MOVT

Move Top. Writes a 16-bit immediate value to the top halfword of a register, without affecting the bottom halfword.

Syntax

MOVT{cond} Rd, #imm16

where:

- **cond** is an optional condition code.
- **Rd** is the destination register.
- **imm16** is a 16-bit immediate value.

Usage

MOVT writes *imm16* to *Rd*[31:16]. The write does not affect *Rd*[15:0].

You can generate any 32-bit immediate with a MOV, MOVT instruction pair. The assembler implements the MOV32 pseudo-instruction for convenient generation of this instruction pair.

Register restrictions

You cannot use PC in ARM or Thumb instructions.

You can use SP for *Rd* in ARM instructions but this is deprecated.

You cannot use SP in Thumb instructions.

Condition flags

This instruction does not change the flags.

Architectures

This ARM instruction is available in ARMv6T2 and above.

This 32-bit Thumb instruction is available in ARMv6T2 and above.

There is no 16-bit Thumb version of this instruction.

See also

Reference

- MOV32 pseudo-instruction on page 3-157
- Condition codes on page 3-162.
3.4.12 TST and TEQ

Test bits and Test Equivalence.

Syntax

TST{cond} Rn, Operand2
TEQ{cond} Rn, Operand2

where:

cond is an optional condition code.
Rn is the ARM register holding the first operand.
Operand2 is a flexible second operand.

Usage

These instructions test the value in a register against Operand2. They update the condition flags on the result, but do not place the result in any register.

The TST instruction performs a bitwise AND operation on the value in Rn and the value of Operand2. This is the same as an ANDS instruction, except that the result is discarded.

The TEQ instruction performs a bitwise Exclusive OR operation on the value in Rn and the value of Operand2. This is the same as a EORS instruction, except that the result is discarded.

Use the TEQ instruction to test if two values are equal, without affecting the V or C flags (as CMP does).

TEQ is also useful for testing the sign of a value. After the comparison, the N flag is the logical Exclusive OR of the sign bits of the two operands.

Register restrictions

In these Thumb instructions, you cannot use SP or PC for Rn or Operand2.

In these ARM instructions, use of SP or PC is deprecated in ARMv6T2 and above.

For ARM instructions:

• if you use PC (R15) as Rn, the value used is the address of the instruction plus 8
• you cannot use PC for any operand in any data processing instruction that has a register-controlled shift.

Condition flags

These instructions:

• update the N and Z flags according to the result
• can update the C flag during the calculation of Operand2
• do not affect the V flag.

16-bit instructions

The following form of the TST instruction is available in Thumb code, and is a 16-bit instruction:

TST Rn, Rm

Rn and Rm must both be Lo registers.
Architectures

These ARM instructions are available in all architectures with ARM.

The TST Thumb instruction is available in all architectures with Thumb.

The TEQ Thumb instruction is available in ARMv6T2 and above.

Examples

TST     r0, #0x3F8
TEQEQ   r10, r9
TSTNE   r1, r5, ASR r1

Incorrect example

TEQ     pc, r1, ROR r0    ; PC not permitted with register
        ; controlled shift

See also

Concepts

• Flexible second operand (Operand2) on page 3-45.

Reference

• Condition codes on page 3-162.
3.4.13  SEL

Select bytes from each operand according to the state of the APSR GE flags.

**Syntax**

```
SEL{cond} {Rd}, Rn, Rm
```

where:

- `cond` is an optional condition code.
- `Rd` is the destination register.
- `Rn` is the register holding the first operand.
- `Rm` is the register holding the second operand.

**Operation**

The SEL instruction selects bytes from `Rn` or `Rm` according to the APSR GE flags:
- if GE[0] is set, `Rd[7:0]` come from `Rn[7:0]`, otherwise from `Rm[7:0]`

**Usage**

Use the SEL instruction after one of the signed parallel instructions. You can use this to select maximum or minimum values in multiple byte or halfword data.

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

This instruction does not change the flags.

**Architectures**

This ARM instruction is available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There is no 16-bit Thumb version of this instruction.

**Examples**

```
SEL     r0, r4, r5
SELLT   r4, r0, r4
```

The following instruction sequence sets each byte in `R4` equal to the unsigned minimum of the corresponding bytes of `R1` and `R2`:

```
USUB8   r4, r1, r2
SEL     r4, r2, r1
```
See also

Reference

- *Parallel add and subtract* on page 3-102
- *Condition codes* on page 3-162.
3.4.14 REV, REV16, REVSH, and RBIT

Reverse bytes or bits within words or halfwords.

Syntax

\[ op\{\text{cond}\} \ R_d, \ R_n \]

where:

- \( op \) is any one of the following:
  - REV: Reverse byte order in a word.
  - REV16: Reverse byte order in each halfword independently.
  - REVSH: Reverse byte order in the bottom halfword, and sign extend to 32 bits.
  - RBIT: Reverse the bit order in a 32-bit word.

- \( \text{cond} \) is an optional condition code.

- \( R_d \) is the destination register.

- \( R_n \) is the register holding the operand.

Usage

You can use these instructions to change endianness:

- REV: converts 32-bit big-endian data into little-endian data or 32-bit little-endian data into big-endian data.
- REV16: converts 16-bit big-endian data into little-endian data or 16-bit little-endian data into big-endian data.
- REVSH: converts either:
  - 16-bit signed big-endian data into 32-bit signed little-endian data
  - 16-bit signed little-endian data into 32-bit signed big-endian data.

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

These instructions do not change the flags.

16-bit instructions

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- REV \( R_d, \ R_m \): \( R_d \) and \( R_m \) must both be Lo registers.
- REV16 \( R_d, \ R_m \): \( R_d \) and \( R_m \) must both be Lo registers.
- REVSH \( R_d, \ R_m \): \( R_d \) and \( R_m \) must both be Lo registers.
Architectures

Other than RBIT, these ARM instructions are available in ARMv6 and above.

The RBIT ARM instruction is available in ARMv6T2 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

These 16-bit Thumb instructions are available in ARMv6 and above.

Examples

REV r3, r7
REV16 r0, r0
REVSH r0, r5 ; Reverse Signed Halfword
REVHS r3, r7 ; Reverse with Higher or Same condition
RBIT r7, r8

Reference

• Condition codes on page 3-162.
3.4.15 ASR, LSL, LSR, ROR, and RRX

Arithmetic Shift Right, Logical Shift Left, Logical Shift Right, Rotate Right, and Rotate Right with Extend.

These instructions are the preferred synonyms for MOV instructions with shifted register operands.

Syntax

\[
\begin{align*}
\text{op}\{S\}\{\text{cond}\} & \quad \text{Rd, Rm, Rs} \\
\text{op}\{S\}\{\text{cond}\} & \quad \text{Rd, Rm, #sh} \\
\text{RRX}\{S\}\{\text{cond}\} & \quad \text{Rd, Rm}
\end{align*}
\]

where:

- \text{op} is one of ASR, LSL, LSR, or ROR.
- \text{S} is an optional suffix. If \text{S} is specified, the condition code flags are updated on the result of the operation.
- \text{Rd} is the destination register.
- \text{Rm} is the register holding the first operand. This operand is shifted right.
- \text{Rs} is a register holding a shift value to apply to the value in \text{Rm}. Only the least significant byte is used.
- \text{sh} is a constant shift. The range of values permitted depends on the instruction:
  - ASR permitted shifts 1-32
  - LSL permitted shifts 0-31
  - LSR permitted shifts 1-32
  - ROR permitted shifts 1-31.

Usage

ASR provides the signed value of the contents of a register divided by a power of two. It copies the sign bit into vacated bit positions on the left.

LSL provides the value of a register multiplied by a power of two. LSR provides the unsigned value of a register divided by a variable power of two. Both instructions insert zeros into the vacated bit positions.

ROR provides the value of the contents of a register rotated by a value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

RRX provides the value of the contents of a register shifted right one bit. The old carry flag is shifted into bit[31]. If the \text{S} suffix is present, the old bit[0] is placed in the carry flag.

Restrictions in Thumb code

Thumb instructions must not use PC or SP.

If you specify zero for the \text{sh} value in an LSL instruction in an IT block, the result is UNPREDICTABLE.
Use of SP and PC in ARM ASR, LSL, LSR, ROR, and RRX instructions

You can use SP in these ARM instructions but these are deprecated in ARMv6T2 and above.

You cannot use PC in instructions with the op{S}{cond} Rd, Rm, Rs syntax. You can use PC for Rd and Rm in the other syntaxes, but these are deprecated in ARMv6T2 and above.

If you use PC as Rm, the value used is the address of the instruction plus 8.

If you use PC as Rd:

- Execution branches to the address corresponding to the result.
- If you use the S suffix, the SPSR of the current mode is copied to the CPSR. You can use this to return from exceptions.

Note

The ARM instructions opS{cond} pc,Rm,#sh and RRXS{cond} pc,Rm always disassemble to the preferred form MOV{cond} pc,Rm{,shift}.

Caution

Do not use the S suffix when using PC as Rd in User mode or System mode. The effect of such an instruction is UNPREDICTABLE, but the assembler cannot warn you at assembly time.

You cannot use PC for Rd or any operand in any of these instructions if they have a register-controlled shift.

Condition flags

If S is specified, these instructions update the N and Z flags according to the result.

The C flag is unaffected if the shift value is 0. Otherwise, the C flag is updated to the last bit shifted out.

16-bit instructions

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- ASRS Rd, Rm, #sh Rd and Rm must both be Lo registers.
- ASRS Rd, Rd, Rs Rd and Rs must both be Lo registers.
- LSLS Rd, Rm, #sh Rd and Rm must both be Lo registers.
- LSLS Rd, Rd, Rs Rd and Rs must both be Lo registers.
- LSRS Rd, Rm, #sh Rd and Rm must both be Lo registers.
- LSRS Rd, Rd, Rs Rd and Rs must both be Lo registers.
- RORS Rd, Rd, Rs Rd and Rs must both be Lo registers.

Architectures

These ARM instructions are available in all architectures.

These 32-bit Thumb instructions are available in ARMv6T2 and above.
These 16-bit Thumb instructions are available in ARMv4T and above.

There is no 16-bit Thumb RRX instruction.

**Examples**

- ASR r7, r8, r9
- LSLS r1, r2, r3
- LSR r4, r5, r6
- ROR r4, r5, r6

**See also**

**Reference**

- *MOV and MVN on page 3-61*

3.4.16 SDIV and UDIV

Signed and Unsigned Divide.

Syntax

\[
\text{SDIV}\{\text{cond}\} \{Rd\}, \ Rn, \ Rm \\
\text{UDIV}\{\text{cond}\} \{Rd\}, \ Rn, \ Rm
\]

where:

\text{cond} \quad \text{is an optional condition code.}

\text{Rd} \quad \text{is the destination register.}

\text{Rn} \quad \text{is the register holding the value to be divided.}

\text{Rm} \quad \text{is a register holding the divisor.}

Register restrictions

PC or SP cannot be used for Rd, Rn or Rm.

Architectures

These 32-bit Thumb instructions are available in ARMv7-R and ARMv7-M only.

There are no ARM or 16-bit Thumb SDIV and UDIV instructions.

3.5 Multiply instructions

This section contains the following subsections:

- **MUL, MLA, and MLS on page 3-76**
  Multiply, Multiply Accumulate, and Multiply Subtract (32-bit by 32-bit, bottom 32-bit result).

- **UMULL, UMLAL, SMULL, and SMLAL on page 3-78**
  Unsigned and signed Long Multiply and Multiply Accumulate (32-bit by 32-bit, 64-bit result or 64-bit accumulator).

- **SMULxy and SMLAxy on page 3-80**
  Signed Multiply and Signed Multiply Accumulate (16-bit by 16-bit, 32-bit result).

- **SMULWy and SMLAWy on page 3-82**
  Signed Multiply and Signed Multiply Accumulate (32-bit by 16-bit, top 32-bit result).

- **SMLALxy on page 3-83**
  Signed Multiply Accumulate (16-bit by 16-bit, 64-bit accumulate).

- **SMUAD{X} and SMUSD{X} on page 3-85**
  Dual 16-bit Signed Multiply with Addition or Subtraction of products.

- **SMMUL, SMMLA, and SMMLS on page 3-87**
  Multiply, Multiply Accumulate, and Multiply Subtract (32-bit by 32-bit, top 32-bit result).

- **SMLAD and SMLSD on page 3-89**
  Dual 16-bit Signed Multiply, 32-bit Accumulation of Sum or Difference of 32-bit products.

- **SMLALD and SMLSLD on page 3-91**
  Dual 16-bit Signed Multiply, 64-bit Accumulation of Sum or Difference of 32-bit products.

- **UMAAL on page 3-93**
  Unsigned Multiply Accumulate Accumulate Long.

- **MIA, MIAPH, and MIAXy on page 3-94**
  Multiplies with Internal Accumulate (XScale coprocessor 0 instructions).
3.5.1 MUL, MLA, and MLS

Multiply, Multiply-Accumulate, and Multiply-Subtract, with signed or unsigned 32-bit operands, giving the least significant 32 bits of the result.

Syntax

\[
\text{MUL\{S\}\{cond\} \{Rd\}, \ Rn, \ Rm} \\
\text{MLA\{S\}\{cond\} Rd, \ Rn, \ Rm, \ Ra} \\
\text{MLS\{cond\} Rd, \ Rn, \ Rm, \ Ra}
\]

where:

\text{cond} is an optional condition code.

\text{S} is an optional suffix. If S is specified, the condition code flags are updated on the result of the operation.

\text{Rd} is the destination register.

\text{Rn, Rm} are registers holding the values to be multiplied.

\text{Ra} is a register holding the value to be added or subtracted from.

Usage

The \text{MUL} instruction multiplies the values from \text{Rn} and \text{Rm}, and places the least significant 32 bits of the result in \text{Rd}.

The \text{MLA} instruction multiplies the values from \text{Rn} and \text{Rm}, adds the value from \text{Ra}, and places the least significant 32 bits of the result in \text{Rd}.

The \text{MLS} instruction multiplies the values from \text{Rn} and \text{Rm}, subtracts the result from the value from \text{Ra}, and places the least significant 32 bits of the final result in \text{Rd}.

Register restrictions

For the \text{MUL} and \text{MLA} instructions, \text{Rn} must be different from \text{Rd} in architectures before ARMv6.

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

If S is specified, the \text{MUL} and \text{MLA} instructions:

- update the N and Z flags according to the result
- corrupt the C and V flag in ARMv4
- do not affect the C or V flag in ARMv5T and above.

Thumb instructions

The following form of the \text{MUL} instruction is available in Thumb code, and is a 16-bit instruction:

\[
\text{MULS \ Rl, \ Rn, \ Rd} \quad \text{Rd and Rn must both be Lo registers.}
\]

There are no other Thumb multiply instructions that can update the condition code flags.
Architectures

The `MUL` and `MLA` ARM instructions are available in all versions of the ARM architecture.

The `MLS` ARM instruction is available in ARMv6T2 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

The `MULS` 16-bit Thumb instruction is available in all T variants of the ARM architecture.

Examples

- `MUL    r10, r2, r5`
- `MLA    r10, r2, r1, r5`
- `MULS   r0, r2, r2`
- `MULLT  r2, r3, r2`
- `MLS    r4, r5, r6, r7`

See also

Reference

- `Condition codes on page 3-162`. 
3.5.2 UMULL, UMLAL, SMULL, and SMLAL

Signed and Unsigned Long Multiply, with optional Accumulate, with 32-bit operands, and 64-bit result and accumulator.

Syntax

\[ \text{Op}\{S\}\{\text{cond}\}\ RdLo,\ RdHi,\ Rn,\ Rm \]

where:

- \(\text{Op}\) is one of UMULL, UMLAL, SMULL, or SMLAL.
- \(S\) is an optional suffix available in ARM state only. If \(S\) is specified, the condition code flags are updated on the result of the operation.
- \(\text{cond}\) is an optional condition code.
- \(RdLo,\ RdHi\) are the destination registers. For UMLAL and SMLAL they also hold the accumulating value. \(RdLo\) and \(RdHi\) must be different registers.
- \(Rn,\ Rm\) are ARM registers holding the operands.

Usage

The UMULL instruction interprets the values from \(Rn\) and \(Rm\) as unsigned integers. It multiplies these integers and places the least significant 32 bits of the result in \(RdLo\), and the most significant 32 bits of the result in \(RdHi\).

The UMLAL instruction interprets the values from \(Rn\) and \(Rm\) as unsigned integers. It multiplies these integers, and adds the 64-bit result to the 64-bit unsigned integer contained in \(RdHi\) and \(RdLo\).

The SMULL instruction interprets the values from \(Rn\) and \(Rm\) as two’s complement signed integers. It multiplies these integers and places the least significant 32 bits of the result in \(RdLo\), and the most significant 32 bits of the result in \(RdHi\).

The SMLAL instruction interprets the values from \(Rn\) and \(Rm\) as two’s complement signed integers. It multiplies these integers, and adds the 64-bit result to the 64-bit signed integer contained in \(RdHi\) and \(RdLo\).

Register restrictions

\(Rn\) must be different from \(RdLo\) and \(RdHi\) in architectures before ARMv6.

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

If \(S\) is specified, these instructions:

- update the N and Z flags according to the result
- do not affect the C or V flags.

Architectures

These ARM instructions are available in all versions of the ARM architecture.
These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

**Examples**

UMULL       r0, r4, r5, r6
UMLALS     r4, r5, r3, r8

**See also**

Reference

•  *Condition codes on page 3-162.*
3.5.3 SMULxy and SMLAxy

Signed Multiply and Multiply Accumulate, with 16-bit operands and a 32-bit result and accumulator.

Syntax

SMUL<x>y{cond} {Rd}, Rn, Rm
SMLA<x>y{cond} Rd, Rn, Rm, Ra

where:
<x> is either B or T. B means use the bottom half (bits [15:0]) of Rn, T means use the top half (bits [31:16]) of Rn.
<y> is either B or T. B means use the bottom half (bits [15:0]) of Rm, T means use the top half (bits [31:16]) of Rm.
cond is an optional condition code.
Rd is the destination register.
Rn, Rm are the registers holding the values to be multiplied.
Ra is the register holding the value to be added.

Usage

SMULxy multiplies the 16-bit signed integers from the selected halves of Rn and Rm, and places the 32-bit result in Rd.

SMLAxy multiplies the 16-bit signed integers from the selected halves of Rn and Rm, adds the 32-bit result to the 32-bit value in Ra, and places the result in Rd.

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

These instructions do not affect the N, Z, C, or V flags.

If overflow occurs in the accumulation, SMLAxy sets the Q flag. To read the state of the Q flag, use an MRS instruction.

Note

SMLAxy never clears the Q flag. To clear the Q flag, use an MSR instruction.

Architectures

These ARM instructions are available in ARMv6 and above, and E variants of ARMv5T.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.
There are no 16-bit Thumb versions of these instructions.

**Examples**

- `SMULTBEQ    r8, r7, r9`
- `SMLABBNE    r0, r2, r1, r10`
- `SMLABT      r0, r0, r3, r5`

**See also**

**Reference**

- *MRS on page 3-136*
- *MSR on page 3-138*
- *Condition codes on page 3-162.*
3.5.4 SMULWy and SMLAWy

Signed Multiply Wide and Signed Multiply-Accumulate Wide, with one 32-bit and one 16-bit operand, providing the top 32-bits of the result.

Syntax

SMULW<y>{cond} {Rd}, Rn, Rm
SMLAW<y>{cond} Rd, Rn, Rm, Ra

where:

<y> is either B or T. B means use the bottom half (bits [15:0]) of Rm, T means use the top half (bits [31:16]) of Rm.

cond is an optional condition code.

Rd is the destination register.

Rn, Rm are the registers holding the values to be multiplied.

Ra is the register holding the value to be added.

Usage

SMULWy multiplies the signed integer from the selected half of Rm by the signed integer from Rn, and places the upper 32-bits of the 48-bit result in Rd.

SMLAWy multiplies the signed integer from the selected half of Rm by the signed integer from Rn, adds the 32-bit result to the 32-bit value in Ra, and places the result in Rd.

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

These instructions do not affect the N, Z, C, or V flags.

If overflow occurs in the accumulation, SMLAWy sets the Q flag.

Architectures

These ARM instructions are available in ARMv6 and above, and E variants of ARMv5T.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

• MRS on page 3-136
• Condition codes on page 3-162.
### 3.5.5 SMLALxy

Signed Multiply-Accumulate with 16-bit operands and a 64-bit accumulator.

#### Syntax

SMLAL\(<x>><y>{\texttt{cond}}\) \(RdLo, RdHi, Rn, Rm\)

where:

\(<x>\) is either B or T. B means use the bottom half (bits [15:0]) of \(Rn\), T means use the top half (bits [31:16]) of \(Rn\).

\(<y>\) is either B or T. B means use the bottom half (bits [15:0]) of \(Rm\), T means use the top half (bits [31:16]) of \(Rm\).

\(cond\) is an optional condition code.

\(RdLo, RdHi\) are the destination registers. They also hold the accumulate value. \(RdHi\) and \(RdLo\) must be different registers.

\(Rn, Rm\) are the registers holding the values to be multiplied.

#### Usage

SMLALxy multiplies the signed integer from the selected half of \(Rm\) by the signed integer from the selected half of \(Rn\), and adds the 32-bit result to the 64-bit value in \(RdHi\) and \(RdLo\).

#### Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

#### Condition flags

This instruction does not change the flags.

--- **Note** ---

SMLALxy cannot raise an exception. If overflow occurs on this instruction, the result wraps round without any warning.

---

#### Architectures

This ARM instruction is available in ARMv6 and above, and E variants of ARMv5T.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There is no 16-bit Thumb version of this instruction.

#### Examples

- SMLALTB \(r2, r3, r7, r1\)
- SMLALBTVS \(r0, r1, r9, r2\)
See also

Reference

• Condition codes on page 3-162.
3.5.6 SMUAD{X} and SMUSD{X}

Dual 16-bit Signed Multiply with Addition or Subtraction of products, and optional exchange of operand halves.

Syntax

\[ \text{op}{\{X\}}\{\text{cond}\} \{\text{Rd}\}, \text{Rn}, \text{Rm} \]

where:

- \text{op} is one of:
  - SMUAD: Dual multiply, add products.
  - SMUSD: Dual multiply, subtract products.
- \text{X} is an optional parameter. If \text{X} is present, the most and least significant halfwords of the second operand are exchanged before the multiplications occur.
- \text{cond} is an optional condition code.
- \text{Rd} is the destination register.
- \text{Rn}, \text{Rm} are the registers holding the operands.

Usage

SMUAD multiplies the bottom halfword of \text{Rn} with the bottom halfword of \text{Rm}, and the top halfword of \text{Rn} with the top halfword of \text{Rm}. It then adds the products and stores the sum to \text{Rd}.

SMUSD multiplies the bottom halfword of \text{Rn} with the bottom halfword of \text{Rm}, and the top halfword of \text{Rn} with the top halfword of \text{Rm}. It then subtracts the second product from the first, and stores the difference to \text{Rd}.

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

The SMUAD instruction sets the Q flag if the addition overflows.

Architectures

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

Examples

\begin{verbatim}
SMUAD      r2, r3, r2
SMUSDXNE    r0, r1, r2
\end{verbatim}
See also

Reference

• Condition codes on page 3-162.
3.5.7 SMMUL, SMMLA, and SMMLS

Signed Most significant word Multiply, Signed Most significant word Multiply with Accumulation, and Signed Most significant word Multiply with Subtraction. These instructions have 32-bit operands and produce only the most significant 32-bits of the result.

**Syntax**

SMMUL{R}\{cond\} {Rd}, Rn, Rm

SMMLA{R}\{cond\} Rd, Rn, Rm, Ra

SMMLS{R}\{cond\} Rd, Rn, Rm, Ra

where:

- R is an optional parameter. If R is present, the result is rounded, otherwise it is truncated.
- cond is an optional condition code.
- Rd is the destination register.
- Rn, Rm are the registers holding the operands.
- Ra is a register holding the value to be added or subtracted from.

**Operation**

SMMUL multiplies the values from Rn and Rm, and stores the most significant 32 bits of the 64-bit result to Rd.

SMMLA multiplies the values from Rn and Rm, adds the value in Ra to the most significant 32 bits of the product, and stores the result in Rd.

SMMLS multiplies the values from Rn and Rm, subtracts the product from the value in Ra shifted left by 32 bits, and stores the most significant 32 bits of the result in Rd.

If the optional R parameter is specified, 0x80000000 is added before extracting the most significant 32 bits. This has the effect of rounding the result.

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not change the flags.

**Architectures**

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.
Examples

SMMULGE     r6, r4, r3
SMMULR      r2, r2, r2

See also

Reference

•   Condition codes on page 3-162.
3.5.8 SMLAD and SMLSD

Dual 16-bit Signed Multiply with Addition or Subtraction of products and 32-bit accumulation.

**Syntax**

```
op{X}{cond} Rd, Rn, Rm, Ra
```

where:

- `op` is one of:
  - `SMLAD` Dual multiply, accumulate sum of products.
  - `SMLSD` Dual multiply, accumulate difference of products.

- `cond` is an optional condition code.

- `X` is an optional parameter. If `X` is present, the most and least significant halfwords of the second operand are exchanged before the multiplications occur.

- `Rd` is the destination register.

- `Rn, Rm` are the registers holding the operands.

- `Ra` is the register holding the accumulate operand.

**Operation**

SMLAD multiplies the bottom halfword of `Rn` with the bottom halfword of `Rm`, and the top halfword of `Rn` with the top halfword of `Rm`. It then adds both products to the value in `Ra` and stores the sum to `Rd`.

SMLSD multiplies the bottom halfword of `Rn` with the bottom halfword of `Rm`, and the top halfword of `Rn` with the top halfword of `Rm`. It then subtracts the second product from the first, adds the difference to the value in `Ra`, and stores the result to `Rd`.

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not change the flags.

**Architectures**

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.
Examples

SMLD       r1, r2, r0, r7
SMLSDX      r11, r10, r2, r3
SMLADLT      r1, r2, r4, r1

See also

Reference

•  Condition codes on page 3-162.
3.5.9 SMLALD and SMLSLD

Dual 16-bit Signed Multiply with Addition or Subtraction of products and 64-bit Accumulation.

**Syntax**

\[
\text{op}(X)\{\text{cond}\} \ RdLo, \ RdHi, \ Rn, \ Rm
\]

where:

- \( \text{op} \) is one of:
  - SMLALD: Dual multiply, accumulate sum of products.
  - SMLSLD: Dual multiply, accumulate difference of products.

- \( X \) is an optional parameter. If \( X \) is present, the most and least significant halfwords of the second operand are exchanged before the multiplications occur.

- \( \text{cond} \) is an optional condition code.

- \( RdLo, \ RdHi \) are the destination registers for the 64-bit result. They also hold the 64-bit accumulate operand. \( RdHi \) and \( RdLo \) must be different registers.

- \( Rn, \ Rm \) are the registers holding the operands.

**Operation**

SMLALD multiplies the bottom halfword of \( Rn \) with the bottom halfword of \( Rm \), and the top halfword of \( Rn \) with the top halfword of \( Rm \). It then adds both products to the value in \( RdLo, \ RdHi \) and stores the sum to \( RdLo, \ RdHi \).

SMLSLD multiplies the bottom halfword of \( Rn \) with the bottom halfword of \( Rm \), and the top halfword of \( Rn \) with the top halfword of \( Rm \). It then subtracts the second product from the first, adds the difference to the value in \( RdLo, \ RdHi \), and stores the result to \( RdLo, \ RdHi \).

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not change the flags.

**Architectures**

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

**Examples**

- SMLALD r10, r11, r5, r1
- SMLSLD r3, r0, r5, r1
See also

Reference

• *Condition codes* on page 3-162.
3.5.10 UMAAL

Unsigned Multiply Accumulate Accumulate Long.

Syntax

\[
\text{UMAAL}\{\text{cond}\} \quad \text{RdLo, RdHi, Rn, Rm}
\]

where:

- \text{cond} \quad \text{is an optional condition code.}
- \text{RdLo, RdHi} \quad \text{are the destination registers for the 64-bit result. They also hold the two 32-bit accumulate operands. RdLo and RdHi must be different registers.}
- \text{Rn, Rm} \quad \text{are the registers holding the multiply operands.}

Operation

The UMAAL instruction multiplies the 32-bit values in \text{Rn} and \text{Rm}, adds the two 32-bit values in \text{RdHi} and \text{RdLo}, and stores the 64-bit result to \text{RdLo, RdHi}.

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

This instruction does not change the flags.

Architectures

This ARM instruction is available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There is no 16-bit Thumb version of this instruction.

Examples

\[
\begin{align*}
\text{UMAAL} & \quad r8, r9, r2, r3 \\
\text{UMAALGE} & \quad r2, r0, r5, r3
\end{align*}
\]

See also

Reference

- Condition codes on page 3-162.
3.5.11 MIA, MIAPH, and MIAxy

Multiply with internal accumulate (32-bit by 32-bit, 40-bit accumulate).

Multiply with internal accumulate, packed halfwords (16-bit by 16-bit twice, 40-bit accumulate).

Multiply with internal accumulate (16-bit by 16-bit, 40-bit accumulate).

Syntax

\[
\begin{align*}
\text{MIA}\{\text{cond}\} & \quad \text{Acc, Rn, Rm} \\
\text{MIAPH}\{\text{cond}\} & \quad \text{Acc, Rn, Rm} \\
\text{MIA}<&x>y\{\text{cond}\} & \quad \text{Acc, Rn, Rm}
\end{align*}
\]

where:

\(\text{cond}\) is an optional condition code.

\(\text{Acc}\) is the internal accumulator. The standard name is acc\(x\), where \(x\) is an integer in the range 0 to \(n\). The value of \(n\) depends on the processor. It is 0 in current processors.

\(\text{Rn, Rm}\) are the ARM registers holding the values to be multiplied.

\(\text{Rn}\) and \(\text{Rm}\) must not be PC.

\(<x>y\) is one of: BB, BT, TB, TT.

Usage

The MIA instruction multiplies the signed integers from \(\text{Rn}\) and \(\text{Rm}\), and adds the result to the 40-bit value in \(\text{Acc}\).

The MIAPH instruction multiplies the signed integers from the bottom halves of \(\text{Rn}\) and \(\text{Rm}\), multiplies the signed integers from the upper halves of \(\text{Rn}\) and \(\text{Rm}\), and adds the two 32-bit results to the 40-bit value in \(\text{Acc}\).

The MIAxy instruction multiplies the signed integer from the selected half of \(\text{Rs}\) by the signed integer from the selected half of \(\text{Rm}\), and adds the 32-bit result to the 40-bit value in \(\text{Acc}\). \(<x>\) == B means use the bottom half (bits [15:0]) of \(\text{Rn}\), \(<x>\) == T means use the top half (bits [31:16]) of \(\text{Rn}\). \(<y>\) == B means use the bottom half (bits [15:0]) of \(\text{Rm}\), \(<y>\) == T means use the top half (bits [31:16]) of \(\text{Rm}\).

Condition flags

These instructions do not change the flags.

Note

These instructions cannot raise an exception. If overflow occurs on these instructions, the result wraps round without any warning.

Architectures

These ARM coprocessor 0 instructions are only available in XScale processors.

There are no Thumb versions of these instructions.
Examples

MIA acc0,r5,r0
MIALE acc0,r1,r9
MIAPH acc0,r0,r7
MIAPHN acc0,r11,r10
MIABB acc0,r8,r9
MIABT acc0,r8,r8
MIATB acc0,r5,r3
MIATT acc0,r0,r6
MIABTGT acc0,r2,r5

3.6 Saturating instructions

This section contains:

- Saturating arithmetic
- \texttt{QADD}, \texttt{QSUB}, \texttt{QDADD}, and \texttt{QDSUB} on page 3-97
- \texttt{SSAT} and \texttt{USAT} on page 3-99.

Some of the parallel instructions are also saturating.

3.6.1 Saturating arithmetic

These operations are saturating (SAT). This means that, for some value of $2^n$ that depends on the instruction:

- for a signed saturating operation, if the full result would be less than $-2^n$, the result returned is $-2^n$
- for an unsigned saturating operation, if the full result would be negative, the result returned is zero
- if the full result would be greater than $2^n - 1$, the result returned is $2^n - 1$.

When any of these things occurs, it is called saturation. Some instructions set the Q flag when saturation occurs.

\begin{quote}
\textbf{Note}\n\end{quote}

Saturating instructions do not clear the Q flag when saturation does not occur. To clear the Q flag, use an \texttt{MSR} instruction.

\begin{quote}
\textbf{Note}\n\end{quote}

The Q flag can also be set by two other instructions, but these instructions do not saturate.

\textbf{See also}

\textbf{Reference}

\begin{itemize}
\item \texttt{MSR} on page 3-138
\item \texttt{SMULxy and SMLAxy} on page 3-80
\item \texttt{SMULWy and SMLAWy} on page 3-82
\item Parallel instructions on page 3-101.
\end{itemize}
3.6.2 QADD, QSUB, QDADD, and QDSUB

Signed Add, Subtract, Double and Add, Double and Subtract, saturating the result to the signed range \(-2^{31} \leq x \leq 2^{31} - 1\).

Syntax

\[
op\{cond\} \{Rd\}, Rm, Rn
\]

where:

- \(op\) is one of QADD, QSUB, QDADD, or QDSUB.
- \(cond\) is an optional condition code.
- \(Rd\) is the destination register.
- \(Rm, Rn\) are the registers holding the operands.

Usage

The QADD instruction adds the values in \(Rm\) and \(Rn\).

The QSUB instruction subtracts the value in \(Rn\) from the value in \(Rm\).

The QDADD instruction calculates \(\text{SAT}(Rm + \text{SAT}(Rn \times 2))\). Saturation can occur on the doubling operation, on the addition, or on both. If saturation occurs on the doubling but not on the addition, the Q flag is set but the final result is unsaturated.

The QDSUB instruction calculates \(\text{SAT}(Rm - \text{SAT}(Rn \times 2))\). Saturation can occur on the doubling operation, on the subtraction, or on both. If saturation occurs on the doubling but not on the subtraction, the Q flag is set but the final result is unsaturated.

Note

All values are treated as two’s complement signed integers by these instructions.

Register restrictions

You cannot use PC for any operand.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

If saturation occurs, these instructions set the Q flag. To read the state of the Q flag, use an MRS instruction.

Architectures

These ARM instructions are available in ARMv6 and above, and E variants of ARMv5T.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.
Examples

QADD  r0, r1, r9
QSUBLT r9, r0, r1

•  *Condition codes on page 3-162.*
3.6.3 SSAT and USAT

Signed Saturate and Unsigned Saturate to any bit position, with optional shift before saturating.

SSAT saturates a signed value to a signed range.

USAT saturates a signed value to an unsigned range.

Syntax

\[
\text{op}\{\text{cond}\}\ \text{Rd, } \#\text{sat, } \text{Rm[ , shift]}\]

where:

- \text{op} is either SSAT or USAT.
- \text{cond} is an optional condition code.
- \text{Rd} is the destination register.
- \text{sat} specifies the bit position to saturate to, in the range 1 to 32 for SSAT, and 0 to 31 for USAT.
- \text{Rm} is the register containing the operand.
- \text{shift} is an optional shift. It must be one of the following:
  - ASR \#n where n is in the range 1-32 (ARM) or 1-31 (Thumb)
  - LSL \#n where n is in the range 0-31.

Operation

The SSAT instruction applies the specified shift, then saturates to the signed range \(-2^{\text{sat}-1} \leq x \leq 2^{\text{sat}-1} - 1\).

The USAT instruction applies the specified shift, then saturates to the unsigned range \(0 \leq x \leq 2^{\text{sat}} - 1\).

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

If saturation occurs, these instructions set the Q flag. To read the state of the Q flag, use an MRS instruction.

Architectures

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.
Examples

SSAT r7, #16, r7, LSL #4
USATNE r0, #7, r5

See also

Reference

• SSAT16 and USAT16 on page 3-106

• Condition codes on page 3-162.
3.7 Parallel instructions

This section contains:

- Parallel add and subtract on page 3-102
  Various byte-wise and halfword-wise additions and subtractions.

- USAD8 and USADA8 on page 3-104
  Unsigned sum of absolute differences, and accumulate unsigned sum of absolute differences.

- SSAT16 and USAT16 on page 3-106
  Parallel halfword saturating instructions.

There are also parallel unpacking instructions such as SXT, SXTA, UXT, and UXTA.

See also

Reference

- SXT, SXTA, UXT, and UXTA on page 3-111
- Packing and unpacking instructions on page 3-108.
3.7.1 Parallel add and subtract

Various byte-wise and halfword-wise additions and subtractions.

**Syntax**

```
<prefix>op{cond} {Rd}, Rn, Rm
```

where:

- `<prefix>` is one of:
  - S: Signed arithmetic modulo $2^8$ or $2^{16}$. Sets APSR GE flags.
  - Q: Signed saturating arithmetic.
  - SH: Signed arithmetic, halving the results.
  - U: Unsigned arithmetic modulo $2^8$ or $2^{16}$. Sets APSR GE flags.
  - UQ: Unsigned saturating arithmetic.
  - UH: Unsigned arithmetic, halving the results.

- `op` is one of:
  - ADD8: Byte-wise Addition
  - ADD16: Halfword-wise Addition.
  - SUB8: Byte-wise Subtraction.
  - SUB16: Halfword-wise Subtraction.
  - ASX: Exchange halfwords of Rm, then Add top halfwords and Subtract bottom halfwords.
  - SAX: Exchange halfwords of Rm, then Subtract top halfwords and Add bottom halfwords.

- `cond` is an optional condition code.

- `Rd` is the destination register.

- `Rm, Rn` are the ARM registers holding the operands.

**Operation**

These instructions perform arithmetic operations separately on the bytes or halfwords of the operands. They perform two or four additions or subtractions, or one addition and one subtraction.

You can choose various kinds of arithmetic:

- Signed or unsigned arithmetic modulo $2^8$ or $2^{16}$. This sets the APSR GE flags.
- Signed saturating arithmetic to one of the signed ranges $-2^{15} \leq x \leq 2^{15} -1$ or $-2^7 \leq x \leq 2^7 -1$. The Q flag is not affected even if these operations saturate.
- Unsigned saturating arithmetic to one of the unsigned ranges $0 \leq x \leq 2^{16} -1$ or $0 \leq x \leq 2^8 -1$. The Q flag is not affected even if these operations saturate.
- Signed or unsigned arithmetic, halving the results. This cannot cause overflow.

**Register restrictions**

You cannot use PC for any register.
You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not affect the N, Z, C, V, or Q flags.

The Q, S, U and UH prefix variants of these instructions do not change the flags.

The S and U prefix variants of these instructions set the GE flags in the APSR as follows:

- For byte-wise operations, the GE flags are used in the same way as the C (Carry) flag for 32-bit SUB and ADD instructions:
  - GE[0] for bits[7:0] of the result

- For halfword-wise operations, the GE flags are used in the same way as the C (Carry) flag for normal word-wise SUB and ADD instructions:
  - GE[1:0] for bits[15:0] of the result

You can use these flags to control a following SEL instruction.

**Note**

For halfword-wise operations, GE[1:0] are set or cleared together, and GE[3:2] are set or cleared together.

**Architectures**

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

**Examples**

- SHADD8      r4, r3, r9
- USAXNE      r0, r0, r2

**Incorrect examples**

- QHADD       r2, r9, r3 ; No such instruction, should be QHADD8 or QHADD16
- SAX         r10, r8, r5 ; Must have a prefix.

**See also**

**Reference**

- *SEL* on page 3-67
- *Condition codes* on page 3-162.
3.7.2 USAD8 and USADA8

Unsigned Sum of Absolute Differences, and Accumulate unsigned sum of absolute differences.

**Syntax**

USAD8{cond} \{Rd\}, Rn, Rm

USADA8{cond} Rd, Rn, Rm, Ra

where:

- \(cond\) is an optional condition code.
- \(Rd\) is the destination register.
- \(Rn\) is the register holding the first operand.
- \(Rm\) is the register holding the second operand.
- \(Ra\) is the register holding the accumulate operand.

**Operation**

The USAD8 instruction finds the four differences between the unsigned values in corresponding bytes of \(Rn\) and \(Rm\). It adds the absolute values of the four differences, and saves the result to \(Rd\).

The USADA8 instruction adds the absolute values of the four differences to the value in \(Ra\), and saves the result to \(Rd\).

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not alter any flags.

**Architectures**

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

**Examples**

USAD8     r2, r4, r6
USADA8    r0, r3, r5, r2
USADA8VS  r0, r4, r0, r1

**Incorrect examples**

USAD8     r2, r4, r6 \; USADA8 requires four registers
USADA16   r0, r4, r0, r1 \; no such instruction
See also

Reference

• *Condition codes* on page 3-162.
3.7.3 SSAT16 and USAT16

Parallel halfword Saturating instructions.

SSAT16 saturates a signed value to a signed range.

USAT16 saturates a signed value to an unsigned range.

Syntax

\[ \text{op} \begin{cases} \text{cond} \end{cases} \text{Rd, } \#\text{sat, } \text{Rn} \]

where:

- \( \text{op} \) is one of:
  - SSAT16: Signed saturation.
  - USAT16: Unsigned saturation.

- \( \text{cond} \) is an optional condition code.

- \( \text{Rd} \) is the destination register.

- \( \text{sat} \) specifies the bit position to saturate to, and is in the range 1 to 16 for SSAT16, or 0 to 15 for USAT16.

- \( \text{Rn} \) is the register holding the operand.

Operation

Halfword-wise signed and unsigned saturation to any bit position.

The SSAT16 instruction saturates each signed halfword to the signed range \(-2^{\text{sat}-1} \leq x \leq 2^{\text{sat}-1} -1\).

The USAT16 instruction saturates each signed halfword to the unsigned range \(0 \leq x \leq 2^{\text{sat}} -1\).

Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

If saturation occurs on either halfword, these instructions set the Q flag. To read the state of the Q flag, use an MRS instruction.

Architectures

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

Examples

\[
\begin{align*}
\text{SSAT16} & \quad r7, \#12, r7 \\
\text{USAT16} & \quad r0, \#7, r5
\end{align*}
\]
Incorrect examples

SSAT16  r1, #16, r2, LSL #4 ; shifts not permitted with halfword saturations

3.8 Packing and unpacking instructions

This section contains the following subsections:

- **BFC and BFI on page 3-109**
  Bit Field Clear and Bit Field Insert.

- **SBFX and UBFX on page 3-110**
  Signed or Unsigned Bit Field extract.

- **SXT, SXTA, UXT, and UXTA on page 3-111**
  Sign Extend or Zero Extend instructions, with optional Add.

- **PKHBT and PKHTB on page 3-113**
  Halfword Packing instructions.
### 3.8.1 BFC and BFI

Bit Field Clear and Bit Field Insert. Clear adjacent bits in a register, or Insert adjacent bits from one register into another.

#### Syntax

- **BFC**
  
  \[
  \text{BFC}\{\text{cond}\} \text{ Rd, } \#\text{lsb, } \#\text{width}
  \]

- **BFI**
  
  \[
  \text{BFI}\{\text{cond}\} \text{ Rd, Rn, } \#\text{lsb, } \#\text{width}
  \]

where:

- \(\text{cond}\) is an optional condition code.
- \(\text{Rd}\) is the destination register.
- \(\text{Rn}\) is the source register.
- \(\text{lsb}\) is the least significant bit that is to be cleared or copied.
- \(\text{width}\) is the number of bits to be cleared or copied. \(\text{width}\) must not be 0, and \((\text{width} + \text{lsb})\) must be less than 32.

#### BFC

\(\text{width}\) bits in \(\text{Rd}\) are cleared, starting at \(\text{lsb}\). Other bits in \(\text{Rd}\) are unchanged.

#### BFI

\(\text{width}\) bits in \(\text{Rd}\), starting at \(\text{lsb}\), are replaced by \(\text{width}\) bits from \(\text{Rn}\), starting at bit[0]. Other bits in \(\text{Rd}\) are unchanged.

#### Register restrictions

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

#### Condition flags

These instructions do not change the flags.

#### Architectures

These ARM instructions are available in ARMv6T2 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

#### See also

- **Condition codes** on page 3-162.
3.8.2 SBFX and UBFX

Signed and Unsigned Bit Field Extract. Copies adjacent bits from one register into the least significant bits of a second register, and sign extends or zero extends to 32 bits.

**Syntax**

\[ \text{op\{cond\}} \ R_d, \ R_n, \ #\text{lsb}, \ #\text{width} \]

where:

- \( \text{op} \) is either \( \text{SBFX} \) or \( \text{UBFX} \).
- \( \text{cond} \) is an optional condition code.
- \( \text{Rd} \) is the destination register.
- \( \text{Rn} \) is the source register.
- \( \text{lsb} \) is the bit number of least significant bit in the bitfield, in the range 0 to 31.
- \( \text{width} \) is the width of the bitfield, in the range 1 to \((32-\text{lsb})\).

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

**Condition flags**

These instructions do not alter any flags.

**Architectures**

These ARM instructions are available in ARMv6T2 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

**See also**

**Reference**

- *Condition codes on page 3-162.*
3.8.3 SXT, SXTA, UXT, and UXTA

Sign extend, Sign extend with Add, Zero extend, and Zero extend with Add.

**Syntax**

\[
\begin{align*}
\text{SXT}<\text{extend}>\{\text{cond}\} & \{\text{Rd}\}, \text{Rm} \{,\text{rotation}\} \\
\text{SXTA}<\text{extend}>\{\text{cond}\} & \{\text{Rd}\}, \text{Rn}, \text{Rm} \{,\text{rotation}\} \\
\text{UXT}<\text{extend}>\{\text{cond}\} & \{\text{Rd}\}, \text{Rm} \{,\text{rotation}\} \\
\text{UXTA}<\text{extend}>\{\text{cond}\} & \{\text{Rd}\}, \text{Rn}, \text{Rm} \{,\text{rotation}\}
\end{align*}
\]

where:

- `<extend>` is one of:
  - B16 Extends two 8-bit values to two 16-bit values.
  - B Extends an 8-bit value to a 32-bit value.
  - H Extends a 16-bit value to a 32-bit value.

- `cond` is an optional condition code.

- `Rd` is the destination register.

- `Rn` is the register holding the number to add (SXTA and UXTA only).

- `Rm` is the register holding the value to extend.

- `rotation` is one of:
  - ROR #8 Value from `Rm` is rotated right 8 bits.
  - ROR #16 Value from `Rm` is rotated right 16 bits.
  - ROR #24 Value from `Rm` is rotated right 24 bits.

If `rotation` is omitted, no rotation is performed.

**Operation**

These instructions do the following:

1. Rotate the value from `Rm` right by 0, 8, 16 or 24 bits.

2. Do one of the following to the value obtained:
   - Extract bits[7:0], sign or zero extend to 32 bits. If the instruction is extend and add, add the value from `Rn`.
   - Extract bits[15:0], sign or zero extend to 32 bits. If the instruction is extend and add, add the value from `Rn`.
   - Extract bits[23:16] and bits[7:0] and sign or zero extend them to 16 bits. If the instruction is extend and add, add them to bits[31:16] and bits[15:0] respectively of `Rn` to form bits[31:16] and bits[15:0] of the result.

**Register restrictions**

You cannot use PC for any register.

You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.
Condition flags

These instructions do not change the flags.

16-bit instructions

The following forms of these instructions are available in Thumb code, and are 16-bit instructions:

- SXTB Rd, Rm  \( Rd \) and \( Rm \) must both be Lo registers.
- SXTH Rd, Rm  \( Rd \) and \( Rm \) must both be Lo registers.
- UXTB Rd, Rm  \( Rd \) and \( Rm \) must both be Lo registers.
- UXTH Rd, Rm  \( Rd \) and \( Rm \) must both be Lo registers.

Architectures

These ARM instructions are available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

These 16-bit Thumb instructions are available in ARMv6 and above.

Examples

- SXTH         r3, r9, r4
- UXTAB16EQ    r0, r0, r4, ROR #16

Incorrect examples

- SXTH         r9, r3, r2, ROR #12 ; rotation must be by 0, 8, 16, or 24.

Reference

-  Condition codes on page 3-162.
3.8.4 PKHBT and PKHTB

Halfword Packing instructions.

Combine a halfword from one register with a halfword from another register. One of the operands can be shifted before extraction of the halfword.

Syntax

PKHBT{cond} {Rd}, Rn, Rm{, LSL #leftshift}
PKHTB{cond} {Rd}, Rn, Rm{, ASR #rightshift}

where:

PKHBT Combines bits[15:0] of Rn with bits[31:16] of the shifted value from Rm.
PKHTB Combines bits[31:16] of Rn with bits[15:0] of the shifted value from Rm.
cond is an optional condition code.
Rd is the destination register.
Rn is the register holding the first operand.
Rm is the register holding the first operand.
leftshift is in the range 0 to 31.
rightshift is in the range 1 to 32.

Register restrictions

You cannot use PC for any register.
You can use SP in ARM instructions but these are deprecated in ARMv6T2 and above. You cannot use SP in Thumb instructions.

Condition flags

These instructions do not change the flags.

Architectures

These ARM instructions are available in ARMv6 and above.
These 32-bit Thumb instructions are available in ARMv6T2 and above. For the ARMv7-M architecture, they are only available in an ARMv7E-M implementation.

There are no 16-bit Thumb versions of these instructions.

Examples

PKHBT r0, r3, r5 ; combine the bottom halfword of R3 with ; the top halfword of R5
PKHBT r0, r3, r5, LSL #16 ; combine the bottom halfword of R3 with ; the top halfword of R5
PKHTB r0, r3, r5, ASR #16 ; combine the top halfword of R3 with ; the top halfword of R5

You can also scale the second operand by using different values of shift.
Incorrect examples

PKHBTEQ r4, r5, r1, ASR #8 ; ASR not permitted with PKHBT

3.9 Branch and control instructions

This section contains the following subsections:

- **B, BL, BX, BLX, and BXJ on page 3-116**
  Branch, Branch with Link, Branch and exchange instruction set, Branch with Link and exchange instruction set, Branch and change instruction set to Jazelle.

- **IT on page 3-119**
  If-Then. IT makes up to four following instructions conditional, with either the same condition, or some with one condition and others with the inverse condition. IT is available only in 32-bit Thumb.

- **CBZ and CBNZ on page 3-122**
  Compare against zero and branch. These instructions are available only in 32-bit Thumb.

- **TBB and TBH on page 3-123**
  Table Branch Byte or Halfword. These instructions are available only in 32-bit Thumb.
3.9.1 B, BL, BX, BLX, and BXJ

Branch, Branch with Link, Branch and exchange instruction set, Branch with Link and exchange instruction set, Branch and change to Jazelle state.

Syntax

\[
\text{op1} \{\text{cond}\} \{.W\} \ label \\
\text{op2} \{\text{cond}\} \ Rm
\]

where:

\text{op1} is one of:
- B Branch.
- BL Branch with link.
- BLX Branch with link, and exchange instruction set.

\text{op2} is one of:
- BX Branch and exchange instruction set.
- BLX Branch with link, and exchange instruction set.
- BXJ Branch, and change to Jazelle execution.

\text{cond} is an optional condition code. \text{cond} is not available on all forms of this instruction.

\text{.W} is an optional instruction width specifier to force the use of a 32-bit B instruction in 32-bit Thumb.

\text{label} is a PC-relative expression.

\text{Rm} is a register containing an address to branch to.

Operation

All these instructions cause a branch to \text{label}, or to the address contained in \text{Rm}. In addition:

- The BL and BLX instructions copy the address of the next instruction into LR (R14, the link register).
- The BX and BLX instructions can change the processor state from ARM to Thumb, or from Thumb to ARM.
  - BLX \ text{label} always changes the state.
  - BX \ text{Rm} and BLX \ text{Rm} derive the target state from bit[0] of \text{Rm}:
    - if bit[0] of \text{Rm} is 0, the processor changes to, or remains in, ARM state
    - if bit[0] of \text{Rm} is 1, the processor changes to, or remains in, Thumb state.
- The BXJ instruction changes the processor state to Jazelle.
Instruction availability and branch ranges

Table 3-9 shows the instructions that are available in ARM and Thumb state. Instructions that are not shown in this table are not available. Notes in brackets show the first architecture version where the instruction is available.

<table>

<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

a. Use .W to instruct the assembler to use this 32-bit instruction.
b. This is an instruction pair.
c. The assembler accepts BX{cond} Rm for code assembled for ARMv4 and converts it to MOV{cond} PC, Rm at link time, unless objects targeted for ARMv4T are present.

Extending branch ranges

Machine-level B and BL instructions have restricted ranges from the address of the current instruction. However, you can use these instructions even if label is out of range. Often you do not know where the linker places label. When necessary, the linker adds code to enable longer branches. The added code is called a *veneer*.

**B in Thumb**

You can use the .W width specifier to force B to generate a 32-bit instruction in Thumb code. B.W always generates a 32-bit instruction, even if the target could be reached using a 16-bit instruction.

For forward references, B without .W always generates a 16-bit instruction in Thumb code, even if that results in failure for a target that could be reached using a 32-bit Thumb instruction.

**BX, BLX, and BXJ in ThumbEE**

These instructions can be used as branches in ThumbEE code, but cannot be used to change state. You cannot use the op{cond} label form of these instructions in ThumbEE. In the register form, bit[0] of Rm must be 1, and execution continues at the target address in ThumbEE state.
Note

BXJ behaves like BX in ThumbEE.

Register restrictions

You can use PC for Rm in the ARM BX instruction, but this is deprecated in ARMv6T2 and above. You cannot use PC in other ARM instructions.

You can use PC for Rm in the Thumb BX instruction. You cannot use PC in other Thumb instructions.

You can use SP for Rm in these ARM instructions but these are deprecated in ARMv6T2 and above.

You can use SP for Rm in the Thumb BX and BLX instructions, but these are deprecated. You cannot use SP in the other Thumb instructions.

Condition flags

These instructions do not change the flags.

Architectures

See Table 3-9 on page 3-117 for details of availability of these instructions in each architecture.

Examples

B       loopA
BLE     ng+8
BL      subC
BLLT    rtX
BEQ     {PC}+4 ; #0x8004

### 3.9.2 IT

The IT (If-Then) instruction makes up to four following instructions (the IT block) conditional. The conditions can be all the same, or some of them can be the logical inverse of the others.

#### Syntax

IT\{x{y{z}}} \{cond\}

where:

- \(x\) specifies the condition switch for the second instruction in the IT block.
- \(y\) specifies the condition switch for the third instruction in the IT block.
- \(z\) specifies the condition switch for the fourth instruction in the IT block.
- \(cond\) specifies the condition for the first instruction in the IT block.

The condition switch for the second, third and fourth instruction in the IT block can be either:

- \(T\) Then. Applies the condition \(cond\) to the instruction.
- \(E\) Else. Applies the inverse condition of \(cond\) to the instruction.

#### Usage

The instructions (including branches) in the IT block, except the BKPT instruction, must specify the condition in the \{\(cond\)\} part of their syntax.

You do not need to write IT instructions in your code, because the assembler generates them for you automatically according to the conditions specified on the following instructions. However, if you do write IT instructions, the assembler validates the conditions specified in the IT instructions against the conditions specified in the following instructions.

Writing the IT instructions ensures that you consider the placing of conditional instructions, and the choice of conditions, in the design of your code.

When assembling to ARM code, the assembler performs the same checks, but does not generate any IT instructions.

With the exception of CMP, CMN, and TST, the 16-bit instructions that normally affect the condition code flags, do not affect them when used inside an IT block.

A BKPT instruction in an IT block is always executed, so it does not need a condition in the \{\(cond\)\} part of its syntax. The IT block continues from the next instruction.

**Note**

You can use an IT block for unconditional instructions by using the AL condition.

Conditional branches inside an IT block have a longer branch range than those outside the IT block.

#### Restrictions

The following instructions are not permitted in an IT block:

- IT
- CBZ and CBNZ
- TBB and TBH
- CPS, CPSID and CPSIE
- SETEND.
Other restrictions when using an IT block are:

- A branch or any instruction that modifies the PC is only permitted in an IT block if it is the last instruction in the block.
- You cannot branch to any instruction in an IT block, unless when returning from an exception handler.
- You cannot use any assembler directives in an IT block.

Note

The assembler shows a diagnostic message when any of these instructions are used in an IT block.

Condition flags

This instruction does not change the flags.

Exceptions

Exceptions can occur between an IT instruction and the corresponding IT block, or within an IT block. This exception results in entry to the appropriate exception handler, with suitable return information in LR and SPSR.

Instructions designed for use as exception returns can be used as normal to return from the exception, and execution of the IT block resumes correctly. This is the only way that a PC-modifying instruction can branch to an instruction in an IT block.

Architectures

This 16-bit Thumb instruction is available in ARMv6T2 and above.

In ARM code, IT is a pseudo-instruction that does not generate any code.

There is no 32-bit version of this instruction.

Example

```
ITTE NE ; IT can be omitted
ANDNE r0, r0, r1 ; 16-bit AND, not ANDS
ADDSNE r2, r2, #1 ; 32-bit ADDS (16-bit ADDS does not set flags in IT block)
MOVEQ r2, r3 ; 16-bit MOV

ITT AL ; emit 2 non-flag setting 16-bit instructions
ADDA r0, r0, r1 ; 16-bit ADD, not ADDS
SUBA r2, r2, #1 ; 16-bit SUB, not SUB
ADD r0, r0, r1 ; expands into 32-bit ADD, and is not in IT block

ITT EQ
MOVEQ r0, r1
BEQ dloop ; branch at end of IT block is permitted

ITT EQ
MOVEQ r0, r1
BKPT #1 ; BKPT always executes
ADDEQ r0, r0, #1
```
Incorrect example

IT  NE
ADD  r0,r0,r1 ; syntax error: no condition code used in IT block
3.9.3 CBZ and CBNZ

Compare and Branch on Zero, Compare and Branch on Non-Zero.

Syntax

CBZ Rn, label
CBNZ Rn, label

where:
Rn is the register holding the operand.
label is the branch destination.

Usage

You can use the CBZ or CBNZ instructions to avoid changing the condition code flags and to reduce the number of instructions.

Except that it does not change the condition code flags, CBZ Rn, label is equivalent to:

```
CMP Rn, #0
BEQ label
```

Except that it does not change the condition code flags, CBNZ Rn, label is equivalent to:

```
CMP Rn, #0
BNE label
```

Restrictions

The branch destination must be within 4 to 130 bytes after the instruction and in the same execution state.

These instructions must not be used inside an IT block.

Condition flags

These instructions do not change the flags.

Architectures

These 16-bit Thumb instructions are available in ARMv6T2 and above.

There are no ARM or 32-bit Thumb versions of these instructions.
3.9.4 TBB and TBH

Table Branch Byte and Table Branch Halfword.

Syntax

TBB [Rn, Rm]
TBH [Rn, Rm, LSL #1]

where:

Rn
is the base register. This contains the address of the table of branch lengths. Rn
must not be SP.
If PC is specified for Rn, the value used is the address of the instruction plus 4.

Rm
is the index register. This contains an index into the table.
Rm must not be PC or SP.

Operation

These instructions cause a PC-relative forward branch using a table of single byte offsets (TBB)
or halfword offsets (TBH). Rn provides a pointer to the table, and Rm supplies an index into the
table. The branch length is twice the value of the byte (TBB) or the halfword (TBH) returned from
the table. The target of the branch table must be in the same execution state.

Notes

In ThumbEE, if the value in the base register is zero, execution branches to the NullCheck
handler at HandlerBase - 4.

Architectures

These 32-bit Thumb instructions are available in ARMv6T2 and above.
There are no ARM, or 16-bit Thumb, versions of these instructions.
3.10 Coprocessor instructions

This section contains the following subsections:

• **CDP and CDP2 on page 3-125**
  Coprocessor Data oPerations.

• **MCR, MCR2, MCRR, and MCRR2 on page 3-126**
  Move to Coprocessor from ARM Register or Registers, possibly with coprocessor operations.

• **MRC, MRC2, MRRC and MRRC2 on page 3-127**
  Move to ARM Register or Registers from Coprocessor, possibly with coprocessor operations.

• **MSR on page 3-128**
  Move to system coprocessor from ARM register.

• **MRS on page 3-129**
  Move to ARM register from system coprocessor.

• **SYS on page 3-130**
  Execute system coprocessor instruction.

• **LDC, LDC2, STC, and STC2 on page 3-131**
  Transfer data between memory and Coprocessor.

**Note**
A coprocessor instruction causes an Undefined Instruction exception if the specified coprocessor is not present, or if it is not enabled.

This section does not describe VFP or Wireless MMX Technology instructions. XScale-specific instructions are described later in this document.

See also

**Reference**

• Chapter 4 NEON and VFP Programming
• Chapter 5 Wireless MMX Technology Instructions
• Miscellaneous instructions on page 3-133.
3.10.1 CDP and CDP2

Coprocessor data operations.

Syntax

\[ \text{op}\{\text{cond}\} \ coproc, \ #\text{opcode1}, \ CRd, \ CRn, \ CRm, \ #\text{opcode2}\]  

where:

- **op** is either CDP or CDP2.
- **cond** is an optional condition code. In ARM code, cond is not permitted for CDP2.
- **coproc** is the name of the coprocessor the instruction is for. The standard name is \( p_n \), where \( n \) is an integer in the range 0 to 15.
- **opcode1** is a 4-bit coprocessor-specific opcode.
- **opcode2** is an optional 3-bit coprocessor-specific opcode.
- **CRd, CRn, CRm** are coprocessor registers.

Usage

The use of these instructions depends on the coprocessor. See the coprocessor documentation for details.

Architectures

The CDP ARM instruction is available in all versions of the ARM architecture.

The CDP2 ARM instruction is available in ARMv5T and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

- *Condition codes on page 3-162.*
3.10.2 MCR, MCR2, MCRR, and MCRR2

Move to Coprocessor from ARM Register or Registers. Depending on the coprocessor, you might be able to specify various operations in addition.

Syntax

\[\text{op1}\{\text{cond}\} \coproc, \#\text{opcode1}, \text{Rt}, \text{CRn}, \text{CRm}\{, \#\text{opcode2}\}\]

\[\text{op2}\{\text{cond}\} \coproc, \#\text{opcode3}, \text{Rt}, \text{Rt2}, \text{CRm}\]

where:

- \(\text{op1}\) is either \text{MCR} or \text{MCR2}.
- \(\text{op2}\) is either \text{MCRR} or \text{MCRR2}.
- \(\text{cond}\) is an optional condition code. In ARM code, \(\text{cond}\) is not permitted for \text{MCR2} or \text{MCRR2}.
- \(\coproc\) is the name of the coprocessor the instruction is for. The standard name is \(p_n\), where \(n\) is an integer in the range 0 to 15.
- \(\text{opcode1}\) is a 3-bit coprocessor-specific opcode.
- \(\text{opcode2}\) is an optional 3-bit coprocessor-specific opcode.
- \(\text{opcode3}\) is a 4-bit coprocessor-specific opcode.
- \(\text{Rt}, \text{Rt2}\) are ARM source registers. \(\text{Rt}\) and \(\text{Rt2}\) must not be PC.
- \(\text{CRn}, \text{CRm}\) are coprocessor registers.

Usage

The use of these instructions depends on the coprocessor. See the coprocessor documentation for details.

Architectures

The \text{MCR} ARM instruction is available in all versions of the ARM architecture.

The \text{MCR2} ARM instruction is available in ARMv5T and above.

The \text{MCRR} ARM instruction is available in ARMv6 and above, and E variants of ARMv5T.

The \text{MCRR2} ARM instruction is available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

- Condition codes on page 3-162.
3.10.3 MRC, MRC2, MRRC and MRRC2

Move to ARM Register or Registers from Coprocessor.

Depending on the coprocessor, you might be able to specify various operations in addition.

Syntax

\[
\begin{align*}
\text{op1}(\text{cond}) & \text{ coproc, } #\text{opcode1}, \text{Rt}, \text{CRn, CRm}, \#\text{opcode2} \\
\text{op2}(\text{cond}) & \text{ coproc, } #\text{opcode3}, \text{Rt}, \text{Rt2, CRm}
\end{align*}
\]

where:

- \text{op1} is either \text{MRC} or \text{MRC2}.
- \text{op2} is either \text{MRRC} or \text{MRRC2}.
- \text{cond} is an optional condition code. In ARM code, \text{cond} is not permitted for \text{MRC2} or \text{MRRC2}.
- \text{coproc} is the name of the coprocessor the instruction is for. The standard name is \text{pn}, where \( n \) is an integer in the range 0 to 15.
- \text{opcode1} is a 3-bit coprocessor-specific opcode.
- \text{opcode2} is an optional 3-bit coprocessor-specific opcode.
- \text{opcode3} is a 4-bit coprocessor-specific opcode.
- \text{Rt}, \text{Rt2} are ARM destination registers. \text{Rt} and \text{Rt2} must not be PC.
  - In \text{MRC} and \text{MRC2}, \text{Rt} can be \text{APSR\_nzcv}. This means that the coprocessor executes an instruction that changes the value of the condition code flags in the APSR.
- \text{CRn}, \text{CRm} are coprocessor registers.

Usage

The use of these instructions depends on the coprocessor. See the coprocessor documentation for details.

Architectures

The \text{MRC} ARM instruction is available in all versions of the ARM architecture.

The \text{MRC2} ARM instruction is available in ARMv5T and above.

The \text{MRRC} ARM instruction is available in ARMv6 and above, and E variants of ARMv5T.

The \text{MRRC2} ARM instruction is available in ARMv6 and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

- \text{Condition codes on page 3-162}. 
3.10.4 MSR

Move to system coprocessor register from ARM register.

Syntax

\[
\text{MSR}\{\text{cond}\} \text{ coproc\_register, } Rn
\]

where:

- \text{cond} is an optional condition code.
- \text{coproc\_register} is the name of the coprocessor register.
- \text{Rn} is the ARM source register. \text{Rn} must not be PC.

Usage

You can use this instruction to write to any CP14 or CP15 coprocessor writable register. A complete list of the applicable coprocessor register names is in the ARMv7-AR Architecture Reference Manual. For example:

\[
\text{MSR SCTL, R1} \text{ ; writes the contents of R1 into the CP15 coprocessor register}
\]

Architectures

This MSR ARM instruction is available in ARMv7-A and ARMv7-R.

This MSR 32-bit Thumb instruction is available in ARMv7-A and ARMv7-R.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

- SYS on page 3-130
- MRS on page 3-129
- MRS on page 3-136
- MSR on page 3-138
- Condition codes on page 3-162
3.10.5 MRS

Move to ARM register from system coprocessor register.

Syntax

\[
\text{MRS}\{\text{cond}\} \ Rn, \ \text{coproc\_register} \\
\text{MRS}\{\text{cond}\} \ \text{APSR\_nzcv}, \ \text{special\_register}
\]

where:

- \text{cond} is an optional condition code.
- \text{coproc\_register} is the name of the coprocessor register.
- \text{special\_register} is the name of the coprocessor register that can be written to AP\text{PSR\_nzcv}. This is only possible for the coprocessor register DBGDSCRint.
- \text{Rn} is the ARM destination register. Rn must not be PC.

Usage

You can use this instruction to read CP14 or CP15 coprocessor registers, with the exception of write-only registers. A complete list of the applicable coprocessor register names is in the ARMv7-AR Architecture Reference Manual. For example:

\[
\text{MRS} \ R1, \ \text{SCTL} \ ; \text{writes the contents of the CP15 coprocessor register SCTL into R1}
\]

Architectures

This MRS ARM instruction is available in ARMv7-A and ARMv7-R.
This MRS 32-bit Thumb instruction is available in ARMv7-A and ARMv7-R.
There are no 16-bit Thumb versions of these instructions.

See also

Reference

- Condition codes on page 3-162

- MSR on page 3-138
- MRS on page 3-136
3.10.6 SYS

Execute system coprocessor instruction.

Syntax

SYS{cond} instruction{, Rn}

where:

cond is an optional condition code.

instruction is the coprocessor instruction to execute.

Rn is an operand to the instruction. For instructions that take an argument, Rn is compulsory. For instructions that do not take an argument, Rn is optional and if it is not specified, R0 is used. Rn must not be PC.

Usage

You can use this instruction to execute special coprocessor instructions such as cache, branch predictor, and TLB operations. The instructions operate by writing to special write-only coprocessor registers. The instruction names are the same as the write-only coprocessor register names and are listed in the ARMv7-AR Architecture Reference Manual. For example:

SYS ICIALUIS ; invalidates all instruction caches Inner Shareable to Point ; of Unification and also flushes branch target cache.

Architectures

The SYS ARM instruction is available in ARMv7-A and ARMv7-R.

The SYS 32-bit Thumb instruction is available in ARMv7-A and ARMv7-R.

There are no 16-bit Thumb versions of these instructions.

• Condition codes on page 3-162.
3.10.7 LDC, LDC2, STC, and STC2

Transfer Data between memory and Coprocessor.

Syntax

\[
\text{op[L]}\{\text{cond}\} \coproc, \ CRd, [\text{Rn}]
\]

\[
\text{op[L]}\{\text{cond}\} \coproc, \ CRd, [\text{Rn}, \#{-}\text{offset}] \ ; \text{offset addressing}
\]

\[
\text{op[L]}\{\text{cond}\} \coproc, \ CRd, [\text{Rn}, \#{-}\text{offset}]! \ ; \text{pre-index addressing}
\]

\[
\text{op[L]}\{\text{cond}\} \coproc, \ CRd, [\text{Rn}], \#{-}\text{offset} \ ; \text{post-index addressing}
\]

\[
\text{op[L]}\{\text{cond}\} \coproc, \ CRd, \text{label}
\]

where:

- \text{op} is one of LDC, LDC2, STC, or STC2.
- \text{cond} is an optional condition code.
  In ARM code, \text{cond} is not permitted for LDC2 or STC2.
- L is an optional suffix specifying a long transfer.
- \coproc is the name of the coprocessor the instruction is for. The standard name is \text{pn}, where \text{n} is an integer in the range 0 to 15.
- CRd is the coprocessor register to load or store.
- Rn is the register on which the memory address is based. If PC is specified, the value used is the address of the current instruction plus eight.
- - is an optional minus sign. If - is present, the offset is subtracted from Rn. Otherwise, the offset is added to Rn.
- offset is an expression evaluating to a multiple of 4, in the range 0 to 1020.
- ! is an optional suffix. If ! is present, the address including the offset is written back into Rn.
- label is a word-aligned PC-relative expression.
  label must be within 1020 bytes of the current instruction.

Usage

The use of these instructions depends on the coprocessor. See the coprocessor documentation for details.

In ThumbEE, if the value in the base register is zero, execution branches to the NullCheck handler at HandlerBase - 4.

Architectures

LDC and STC are available in all versions of the ARM architecture.

LDC2 and STC2 are available in ARMv5T and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of these instructions.
Register restrictions

You cannot use PC for \( R_n \) in the pre-index and post-index instructions. These are the forms that write back to \( R_n \).

You cannot use PC for \( R_n \) in Thumb STC and STC2 instructions.

ARM STC and STC2 instructions that use the label syntax, or where \( R_n \) is PC, are deprecated in ARMv6T2 and above.

3.11 Miscellaneous instructions

This section contains the following subsections:

- **BKPT** on page 3-134
  Breakpoint.

- **SVC** on page 3-135
  Supervisor Call (formerly SWI).

- **MRS** on page 3-136
  Move the contents of the CPSR or SPSR to a general-purpose register.

- **MSR** on page 3-138
  Load specified fields of the CPSR or SPSR with an immediate value, or from the contents of a general-purpose register.

- **CPS** on page 3-140
  Change Processor State.

- **SMC** on page 3-141
  Secure Monitor Call (formerly SMI).

- **SETEND** on page 3-142
  Set the Endianness bit in the CPSR.

- **NOP** on page 3-143
  No Operation.

- **SEV, WFE, WFI, and YIELD** on page 3-144
  Set Event, Wait For Event, Wait for Interrupt, and Yield hint instructions.

- **DBG** on page 3-146
  Debug.

- **DMB, DSB, and ISB** on page 3-147
  Data Memory Barrier, Data Synchronization Barrier, and Instruction Synchronization Barrier hint instructions.

- **MAR and MRA** on page 3-149
  Transfer between two general-purpose registers and a 40-bit internal accumulator (XScale coprocessor 0 instructions).
3.11.1 BKPT

Breakpoint.

Syntax

BKPT #imm

where:

imm is an expression evaluating to an integer in the range:

- 0-65535 (a 16-bit value) in an ARM instruction
- 0-255 (an 8-bit value) in a 16-bit Thumb instruction.

Usage

The BKPT instruction causes the processor to enter Debug state. Debug tools can use this to investigate system state when the instruction at a particular address is reached.

In both ARM state and Thumb state, imm is ignored by the ARM hardware. However, a debugger can use it to store additional information about the breakpoint.

BKPT is an unconditional instruction. It must not have a condition code in ARM code. In Thumb code, the BKPT instruction does not need a condition code suffix because BKPT always executes irrespective of its condition code suffix.

Architectures

This ARM instruction is available in ARMv5T and above.

This 16-bit Thumb instruction is available in ARMv5T and above.

There is no 32-bit Thumb version of this instruction.
3.11.2 SVC

SuperVisor Call.

Syntax

\[ \text{SVC}\{\text{cond}\} \#\text{imm} \]

where:

\( \text{cond} \) is an optional condition code.

\( \text{imm} \) is an expression evaluating to an integer in the range:

- 0 to \( 2^{24}-1 \) (a 24-bit value) in an ARM instruction
- 0-255 (an 8-bit value) in a 16-bit Thumb instruction.

Usage

The SVC instruction causes an exception. This means that the processor mode changes to Supervisor, the CPSR is saved to the Supervisor mode SPSR, and execution branches to the SVC vector.

-imm is ignored by the processor. However, it can be retrieved by the exception handler to determine what service is being requested.

--- Note ---

SVC was called SWI in earlier versions of the ARM assembly language. SWI instructions disassemble to SVC, with a comment to say that this was formerly SWI.

---

Condition flags

This instruction does not change the flags.

Architectures

This ARM instruction is available in all versions of the ARM architecture.

This 16-bit Thumb instruction is available in all T variants of the ARM architecture.

There is no 32-bit Thumb version of this instruction.

Concepts

*Developing Software for ARM Processors:*

- Chapter 6 Handling Processor Exceptions.

Reference

- *Condition codes on page 3-162.*
3.11.3 MRS

Move the contents of a PSR to a general-purpose register.

**Syntax**

\[ \text{MRS}\{\text{cond}\}; \text{Rd, psr} \]

where:

- \textit{cond} is an optional condition code.
- \textit{Rd} is the destination register.
- \textit{psr} is one of:
  - \texttt{APSR} on any processor, in any mode.
  - \texttt{CPSR} deprecated synonym for APSR and for use in Debug state, on any processor except ARMv7-M and ARMv6-M.
  - \texttt{SPSR} on any processor except ARMv7-M and ARMv6-M, in privileged software execution only.
  - \texttt{Mpsr} on ARMv7-M and ARMv6-M processors only.

\texttt{Mpsr} can be any of: \texttt{IPSR}, \texttt{EPSR}, \texttt{IEPSR}, \texttt{IAPSR}, \texttt{EAPSR}, \texttt{MSP}, \texttt{PSP}, \texttt{XPSR}, \texttt{PRIMASK}, \texttt{BASEPRI}, \texttt{BASEPRI\_MAX}, \texttt{FAULTMASK}, or \texttt{CONTROL}.

**Usage**

Use \texttt{MRS} in combination with \texttt{MSR} as part of a read-modify-write sequence for updating a PSR, for example to change processor mode, or to clear the Q flag.

In process swap code, the programmers’ model state of the process being swapped out must be saved, including relevant PSR contents. Similarly, the state of the process being swapped in must also be restored. These operations make use of \texttt{MRS/store and load/MSR instruction sequences.}

**SPSR**

You must not attempt to access the SPSR when the processor is in User or System mode. This is your responsibility. The assembler cannot warn you about this, because it has no information about the processor mode at execution time.

If you attempt to access the SPSR when the processor is in User or System mode, the result is UNPREDICTABLE.

**CPSR**

The CPSR endianness bit (E) can be read in any privileged software execution.

The CPSR execution state bits, other than the E bit, can only be read when the processor is in Debug state, halting debug-mode. Otherwise, the execution state bits in the CPSR read as zero.

The condition flags can be read in any mode on any processor. Use APSR if you are only interested in accessing the condition code flags in User mode.
Register restrictions
You cannot use PC in ARM instructions. You can use SP for \$d in ARM instructions but this is deprecated in ARMv6T2 and above.

You cannot use PC or SP in Thumb instructions.

Condition flags
This instruction does not change the flags.

Architectures
This ARM instruction is available in all versions of the ARM architecture.
These 32-bit Thumb instructions are available in ARMv6T2 and above.
There is no 16-bit Thumb version of this instruction.

See also

Concepts
Using the Assembler:
•  Current Program Status Register on page 3-20.

Reference
•  MSR on page 3-138
•  MSR on page 3-128
•  MRS on page 3-129
•  Condition codes on page 3-162.
3.11.4 MSR

Load an immediate value, or the contents of a general-purpose register, into specified fields of a Program Status Register (PSR).

Syntax

\[ \text{MSR}\{\text{cond}\} \text{ APSR}_\text{flags}, Rm \]

where:
- \( \text{cond} \) is an optional condition code.
- \( \text{flags} \) specifies the APSR flags to be moved. \( \text{flags} \) can be one or more of:
  - \( \text{nzcqv} \) ALU flags field mask, PSR\[31:27\] (User mode)
  - \( g \) SIMD GE flags field mask, PSR\[19:16\] (User mode).
- \( Rm \) is the source register. \( Rm \) must not be PC.

Syntax (except ARMv7-M and ARMv6-M)

You can also use the following syntax on architectures other than ARMv7 and ARMv6M.

\[ \text{MSR}\{\text{cond}\} \text{ APSR}_\text{flags}, \#\text{constant} \]
\[ \text{MSR}\{\text{cond}\} \text{ psr}_\text{fields}, \#\text{constant} \]
\[ \text{MSR}\{\text{cond}\} \text{ psr}_\text{fields}, Rm \]

where:
- \( \text{cond} \) is an optional condition code.
- \( \text{flags} \) specifies the APSR flags to be moved. \( \text{flags} \) can be one or more of:
  - \( \text{nzcqv} \) ALU flags field mask, PSR\[31:27\] (User mode)
  - \( g \) SIMD GE flags field mask, PSR\[19:16\] (User mode).
- \( \text{constant} \) is an expression evaluating to a numeric value. The value must correspond to an 8-bit pattern rotated by an even number of bits within a 32-bit word. Not available in Thumb.
- \( Rm \) is the source register. \( Rm \) must not be PC.
- \( \text{psr} \) is one of:
  - CPSR for use in Debug state, also deprecated synonym for APSR
  - SPSR on any processor, in privileged software execution only.
- \( \text{fields} \) specifies the SPSR or CPSR fields to be moved. \( \text{fields} \) can be one or more of:
  - \( c \) control field mask byte, PSR\[7:0\] (privileged software execution)
  - \( x \) extension field mask byte, PSR\[15:8\] (privileged software execution)
  - \( s \) status field mask byte, PSR\[23:16\] (privileged software execution)
  - \( f \) flags field mask byte, PSR\[31:24\] (privileged software execution).

Syntax (ARMv7-M and ARMv6-M only)

You can also use the following syntax on ARMv7 and ARMv6M.

\[ \text{MSR}\{\text{cond}\} \text{ psr}, Rm \]
where:

\[ \text{cond} \] is an optional condition code.

\[ Rm \] is the source register. \( Rm \) must not be PC.

\[ psr \] can be any of: APSR, IPSR, EPSR, IEPSR, IAPSR, EAPSR, XPSR, MSP, PSP, PRIMASK, BASEPRI, BASEPRI_MAX, FAULTMASK, or CONTROL.

**Usage**

In User mode:

- Use APSR to access condition flags, Q, or GE bits.
- Writes to unallocated, privileged or execution state bits in the CPSR are ignored. This ensures that User mode programs cannot change to privileged software execution.

If you access the SPSR when in User or System mode, the result is **UNPREDICTABLE**.

**Register restrictions**

You cannot use PC in ARM instructions. You can use SP for \( Rm \) in ARM instructions but these are deprecated in ARMv6T2 and above.

You cannot use PC or SP in Thumb instructions.

**Condition flags**

This instruction updates the flags explicitly if the APSR\_nzcvq or CPSR\_f field is specified.

**Architectures**

This ARM instruction is available in all versions of the ARM architecture.

This 32-bit Thumb instruction is available in ARMv6T2 and above.

There is no 16-bit Thumb version of this instruction.

**See also**

**Reference**

- MRS on page 3-136
- MRS on page 3-129
- MSR on page 3-128
- Condition codes on page 3-162.
3.11.5 CPS

CPS (Change Processor State) changes one or more of the mode, A, I, and F bits in the CPSR, without changing the other CPSR bits.

CPS is only permitted in privileged software execution, and has no effect in User mode.

CPS cannot be conditional, and is not permitted in an IT block.

Syntax

CPS\text{\textit{effect}} \text{\textit{i}flags}, \text{\#\textit{mode}}

CPS \text{\#\textit{mode}}

where:

\textit{effect} is one of:

IE \quad \text{Interrupt or abort enable.}
ID \quad \text{Interrupt or abort disable.}

\textit{i}flags is a sequence of one or more of:

a \quad \text{Enables or disables imprecise aborts.}
i \quad \text{Enables or disables IRQ interrupts.}
f \quad \text{Enables or disables FIQ interrupts.}

\textit{mode} specifies the number of the mode to change to.

Condition flags

This instruction does not change the condition flags.

16-bit instructions

The following instructions are available in Thumb code, and are 16-bit instructions:

• CPSIE \textit{i}flags
• CPSID \textit{i}flags

You cannot specify a mode change in a 16-bit Thumb instruction.

Architectures

This ARM instruction is available in ARMv6 and above.

This 32-bit Thumb instruction are available in ARMv6T2 and above.

This 16-bit Thumb instruction is available in T variants of ARMv6 and above.

Examples

CPSIE if ; enable interrupts and fast interrupts
CPSID A ; disable imprecise aborts
CPSID ai, #17 ; disable imprecise aborts and interrupts, and enter FIQ mode
CPS #16 ; enter User mode
### 3.11.6 SMC

Secure Monitor Call.

#### Syntax

SMC\{cond\} \#imm4

where:

- **cond** is an optional condition code.
- **imm4** is a 4-bit immediate value. This is ignored by the ARM processor, but can be used by the SMC exception handler to determine what service is being requested.

#### Note

SMC was called SMI in earlier versions of the ARM assembly language. SMI instructions disassemble to SMC, with a comment to say that this was formerly SMI.

#### Architectures

This ARM instruction is available in implementations of ARMv6 and above, if they have the Security Extensions.

This 32-bit Thumb instruction is available in implementations of ARMv6T2 and above, if they have the Security Extensions.

There is no 16-bit Thumb version of this instruction.

#### See also

**Reference**

- *Condition codes on page 3-162*
3.11.7 SETEND

Set the endianness bit in the CPSR, without affecting any other bits in the CPSR. SETEND cannot be conditional, and is not permitted in an IT block.

Syntax

SETEND specifier

where:

specifier is one of:

BE Big-endian.
LE Little-endian.

Usage

Use SETEND to access data of different endianness, for example, to access several big-endian DMA-formatted data fields from an otherwise little-endian application.

Architectures

This ARM instruction is available in ARMv6 and above.

This 16-bit Thumb instruction is available in T variants of ARMv6 and above, except the ARMv6-M and ARMv7-M architectures.

There is no 32-bit Thumb version of this instruction.

Example

```
SETEND BE          ; Set the CPSR E bit for big-endian accesses
LDR     r0, [r2, #header]
LDR     r1, [r2, #CRC32]
SETEND  le          ; Set the CPSR E bit for little-endian accesses for the
                   ; rest of the application
```
3.11.8 NOP

No Operation.

Syntax

NOP{cond};

where:

cond is an optional condition code.

Usage

NOP does nothing. If NOP is not implemented as a specific instruction on your target architecture, the assembler treats it as a pseudo-instruction and generates an alternative instruction that does nothing, such as MOV r0, r0 (ARM) or MOV r8, r8 (Thumb).

NOP is not necessarily a time-consuming NOP. The processor might remove it from the pipeline before it reaches the execution stage.

You can use NOP for padding, for example to place the following instruction on a 64-bit boundary in ARM, or a 32-bit boundary in Thumb.

Architectures

This ARM instructions are available in ARMv6K and above.

This 32-bit Thumb instructions are available in ARMv6T2 and above.

This 16-bit Thumb instructions are available in ARMv6T2 and above.

NOP is available on all other ARM and Thumb architectures as a pseudo-instruction.

See also

Reference

• Condition codes on page 3-162.
3.11.9 SEV, WFE, WFI, and YIELD

Set Event, Wait For Event, Wait for Interrupt, and Yield.

**Syntax**

SEV\{cond\}

WFE\{cond\}

WFI\{cond\}

YIELD\{cond\}

where:

cond is an optional condition code.

**Usage**

These are hint instructions. It is optional whether they are implemented or not. If any one of them is not implemented, it executes as a NOP. The assembler produces a diagnostic message if the instruction executes as a NOP on the target.

SEV, WFE, WFI, and YIELD execute as NOP instructions in ARMv6T2.

**SEV**

SEV causes an event to be signaled to all cores within a multiprocessor system. If SEV is implemented, WFE must also be implemented.

**WFE**

If the Event Register is not set, WFE suspends execution until one of the following events occurs:

- an IRQ interrupt, unless masked by the CPSR I-bit
- an FIQ interrupt, unless masked by the CPSR F-bit
- an Imprecise Data abort, unless masked by the CPSR A-bit
- a Debug Entry request, if Debug is enabled
- an Event signaled by another processor using the SEV instruction.

If the Event Register is set, WFE clears it and returns immediately.

If WFE is implemented, SEV must also be implemented.

**WFI**

WFI suspends execution until one of the following events occurs:

- an IRQ interrupt, regardless of the CPSR I-bit
- an FIQ interrupt, regardless of the CPSR F-bit
- an Imprecise Data abort, unless masked by the CPSR A-bit
- a Debug Entry request, regardless of whether Debug is enabled.

**YIELD**

YIELD indicates to the hardware that the current thread is performing a task, for example a spinlock, that can be swapped out. Hardware can use this hint to suspend and resume threads in a multithreading system.
Architectures

These ARM instructions are available in ARMv6K and above.
These 32-bit Thumb instructions are available in ARMv6T2 and above.
These 16-bit Thumb instructions are available in ARMv6T2 and above.

See also

Reference

• NOP on page 3-143
• Condition codes on page 3-162.
3.11.10 DBG

Debug.

Syntax

DBG{cond} {option}

where:

cond is an optional condition code.

option is an optional limitation on the operation of the hint. The range is 0-15.

Usage

DBG is a hint instruction. It is optional whether they are implemented or not. If it is not implemented, it behaves as a NOP. The assembler produces a diagnostic message if the instruction executes as NOP on the target.

DBG executes as a NOP instruction in ARMv6K and ARMv6T2.

Debug hint provides a hint to debug and related systems. See their documentation for what use (if any) they make of this instruction.

Architectures

These ARM instructions are available in ARMv6K and above.

These 32-bit Thumb instructions are available in ARMv6T2 and above.

There are no 16-bit Thumb versions of this instruction.

See also

Reference

• NOP on page 3-143
• Condition codes on page 3-162.
3.11.11 DMB, DSB, and ISB

Data Memory Barrier, Data Synchronization Barrier, and Instruction Synchronization Barrier.

Syntax

DMB{cond} {option}
DSB{cond} {option}
ISB{cond} {option}

where:

cond is an optional condition code.

option is an optional limitation on the operation of the hint.

DMB

Data Memory Barrier acts as a memory barrier. It ensures that all explicit memory accesses that appear in program order before the DMB instruction are observed before any explicit memory accesses that appear in program order after the DMB instruction. It does not affect the ordering of any other instructions executing on the processor.

Permitted values of option are:

SY Full system DMB operation. This is the default and can be omitted.
ST DMB operation that waits only for stores to complete.
ISH DMB operation only to the inner shareable domain.
ISHST DMB operation that waits only for stores to complete, and only to the inner shareable domain.
NSH DMB operation only out to the point of unification.
NSHST DMB operation that waits only for stores to complete and only out to the point of unification.
OSH DMB operation only to the outer shareable domain.
OSHST DMB operation that waits only for stores to complete, and only to the outer shareable domain.

DSB

Data Synchronization Barrier acts as a special kind of memory barrier. No instruction in program order after this instruction executes until this instruction completes. This instruction completes when:

• All explicit memory accesses before this instruction complete.
• All Cache, Branch predictor and TLB maintenance operations before this instruction complete.

Permitted values of option are:

SY Full system DSB operation. This is the default and can be omitted.
ST DSB operation that waits only for stores to complete.
ISH DSB operation only to the inner shareable domain.
ISHST  DSB operation that waits only for stores to complete, and only to the inner shareable domain.

NSH  DSB operation only out to the point of unification.

NSHST  DSB operation that waits only for stores to complete and only out to the point of unification.

OSH  DSB operation only to the outer shareable domain.

OSHST  DSB operation that waits only for stores to complete, and only to the outer shareable domain.

**ISB**

Instruction Synchronization Barrier flushes the pipeline in the processor, so that all instructions following the ISB are fetched from cache or memory, after the instruction has been completed. It ensures that the effects of context altering operations, such as changing the ASID, or completed TLB maintenance operations, or branch predictor maintenance operations, in addition to all changes to the CP15 registers, executed before the ISB instruction are visible to the instructions fetched after the ISB.

In addition, the ISB instruction ensures that any branches that appear in program order after it are always written into the branch prediction logic with the context that is visible after the ISB instruction. This is required to ensure correct execution of the instruction stream.

Permitted values of option are:

SY  Full system ISB operation. This is the default, and can be omitted.

**Alias**

The following alternative values of option are supported for DMB and DSB, but ARM recommends that you do not use them:

- SH is an alias for ISH
- SHST is an alias for ISHST
- UN is an alias for NSH
- UNST is an alias for NSHST

**Architectures**

These ARM and 32-bit Thumb instructions are available in ARMv7.

There are no 16-bit Thumb versions of these instructions.

**See also**

**Reference**

- *Condition codes on page 3-162.*
3.11.12 MAR and MRA

Transfer between two general-purpose registers and a 40-bit internal accumulator.

Syntax

\[
\text{MAR}\{\text{cond}\} \quad \text{Acc}, \text{RdLo}, \text{RdHi} \\
\text{MRA}\{\text{cond}\} \quad \text{RdLo}, \text{RdHi}, \text{Acc}
\]

where:

- \text{cond} is an optional condition code.
- \text{Acc} is the internal accumulator. The standard name is acc\(_x\), where \(x\) is an integer in the range 0 to \(n\). The value of \(n\) depends on the processor. It is 0 for current processors.
- \text{RdLo}, \text{RdHi} are general-purpose registers. \text{RdLo} and \text{RdHi} must not be the PC, and for MRA they must be different registers.

Usage

The MAR instruction copies the contents of \text{RdLo} to bits[31:0] of \text{Acc}, and the least significant byte of \text{RdHi} to bits[39:32] of \text{Acc}.

The MRA instruction:
- copies bits[31:0] of \text{Acc} to \text{RdLo}
- copies bits[39:32] of \text{Acc} to \text{RdHi} bits[7:0]
- sign extends the value by copying bit[39] of \text{Acc} to bits[31:8] of \text{RdHi}.

Architectures

These ARM coprocessor 0 instructions are only available in XScale processors.

There are no Thumb versions of these instructions.

Examples

- MAR acc0, r0, r1
- MRA r4, r5, acc0
- MARNE acc0, r9, r2
- MRACT r4, r8, acc0

See also

Reference
- Condition codes on page 3-162.
3.12 ThumbEE instructions

Apart from ENTERX and LEAVEX, these ThumbEE instructions are only accepted when the assembler has been switched into the ThumbEE state using the --thumbx command line option or the THUMBX directive.

This section contains the following subsections:

- **ENTERX and LEAVEX** on page 3-151
  Switch between Thumb state and ThumbEE state.

- **CHKA** on page 3-152
  Check array.

- **HB, HBL, HBLP, and HBP** on page 3-153
  Handler Branch, branches to a specified handler.
3.12.1 ENTERX and LEAVEX

Switch between Thumb state and ThumbEE state.

Syntax

ENTERX
LEAVEX

Usage

ENTERX causes a change from Thumb state to ThumbEE state, or has no effect in ThumbEE state.

LEAVEX causes a change from ThumbEE state to Thumb state, or has no effect in Thumb state.

Do not use ENTERX or LEAVEX in an IT block.

Architectures

These instructions are not available in the ARM instruction set.

These 32-bit Thumb and ThumbEE instructions are available in ARMv7, with ThumbEE support.

There are no 16-bit Thumb versions of these instructions.

See also

Reference

• *ARM Architecture Reference Manual*,
3.12.2 CHKA

CHKA (Check Array) compares the unsigned values in two registers.

If the value in the first register is lower than, or the same as, the second, it copies the PC to the LR, and causes a branch to the IndexCheck handler.

Syntax

CHKA Rn, Rm

where:
Rn contains the array size. Rn must not be PC.
Rm contains the array index. Rn must not be PC or SP.

Architectures

This instruction is not available in ARM state.

This 16-bit ThumbEE instruction is only available in ARMv7, with ThumbEE support.
3.12.3 HB, HBL, HBLP, and HBP

Handler Branch, branches to a specified handler.

This instruction can optionally store a return address to the LR, pass a parameter to the handler, or both.

**Syntax**

HB{L} #HandlerID

HB{L}P #imm, #HandlerID

where:

- **L** is an optional suffix. If L is present, the instruction saves a return address in the LR.

- **P** is an optional suffix. If P is present, the instruction passes the value of imm to the handler in R8.

- **imm** is an immediate value. If L is present, imm must be in the range 0-31, otherwise imm must be in the range 0-7.

- **HandlerID** is the index number of the handler to be called. If P is present, HandlerID must be in the range 0-31, otherwise HandlerID must be in the range 0-255.

**Architectures**

These instructions are not available in ARM state.

These 16-bit ThumbEE instructions are only available in ThumbEE state, in ARMv7 with ThumbEE support.
3.13 Pseudo-instructions

The ARM assembler supports a number of pseudo-instructions that are translated into the appropriate combination of ARM, or Thumb instructions at assembly time.

The pseudo-instructions are described in the following sections:

- **ADRL pseudo-instruction on page 3-155**
  Load a PC-relative or register-relative address into a register (medium range, position independent)

- **MOV32 pseudo--instruction on page 3-157**
  Load a register with a 32-bit immediate value or an address (unlimited range, but not position independent). Available for ARMv6T2 and above only.

- **LDR pseudo-instruction on page 3-158**
  Load a register with a 32-bit immediate value or an address (unlimited range, but not position independent). Available for all ARM architectures.

- **UND pseudo-instruction on page 3-161**
  Generate an architecturally undefined instruction. Available for all ARM architectures.
3.13.1  ADRL pseudo-instruction

Load a PC-relative or register-relative address into a register. It is similar to the ADR instruction. ADRL can load a wider range of addresses than ADR because it generates two data processing instructions.

Note
When assembling Thumb instructions, ADRL is only available in ARMv6T2 and later.

Syntax

\[ \text{ADRL}\{\text{cond}\} \ \text{Rd}, \text{label} \]

where:

\( \text{cond} \) is an optional condition code.

\( \text{Rd} \) is the register to load.

\( \text{label} \) is a PC-relative or register-relative expression.

Usage
ADRL always assembles to two 32-bit instructions. Even if the address can be reached in a single instruction, a second, redundant instruction is produced.

If the assembler cannot construct the address in two instructions, it generates an error message and the assembly fails. You can use the LDR pseudo-instruction for loading a wider range of addresses.

ADRL produces position-independent code, because the address is PC-relative or register-relative.

If \( \text{label} \) is PC-relative, it must evaluate to an address in the same assembler area as the ADRL pseudo-instruction.

If you use ADRL to generate a target for a BX or BLX instruction, it is your responsibility to set the Thumb bit (bit 0) of the address if the target contains Thumb instructions.

Architectures and range

The available range depends on the instruction set in use:

**ARM**

The range of the instruction is any value that can be generated by two ADD or two SUB instructions. That is, any value that can be produced by the addition of two values, each of which is 8 bits rotated right by any even number of bits within a 32-bit word. See *Operand2 as a constant* on page 3-45 for more information.

**32-bit Thumb**

±1MB bytes to a byte, halfword, or word-aligned address.

**16-bit Thumb**

ADRL is not available.

The given range is relative to a point four bytes (in Thumb code) or two words (in ARM code) after the address of the current instruction.

• ARM Architecture Reference Manual,
3.13.2 MOV32 pseudo-instruction

Load a register with either:
- a 32-bit immediate value
- any address.

MOV32 always generates two 32-bit instructions, a MOV, MOVT pair. This enables you to load any 32-bit immediate, or to access the whole 32-bit address space.

Syntax

MOV32{cond} Rd, expr

where:
- cond is an optional condition code.
- Rd is the register to be loaded. Rd must not be SP or PC.
- expr can be any one of the following:
  - symbol A label in this or another program area.
  - #constant Any 32-bit immediate value.
  - symbol + constant A label plus a 32-bit immediate value.

Usage

The main purposes of the MOV32 pseudo-instruction are:

- To generate literal constants when an immediate value cannot be generated in a single instruction.
- To load a PC-relative or external address into a register. The address remains valid regardless of where the linker places the ELF section containing the MOV32.

Note

An address loaded in this way is fixed at link time, so the code is not position-independent.

MOV32 sets the Thumb bit (bit 0) of the address if the label referenced is in Thumb code.

Architectures

This pseudo-instruction is available in ARMv6T2 and above in both ARM and Thumb.

Examples

MOV32 r3, #0xABCDEF12 ; loads 0xABCDEF12 into R3
MOV32 r1, Trigger+12 ; loads the address that is 12 bytes higher than ; the address Trigger into R1

See also

Reference
- Condition codes on page 3-162.
3.13.3 LDR pseudo-instruction

Load a register with either:

- a 32-bit immediate value
- an address.

--- Note

This section describes the LDR pseudo-instruction only, and not the LDR instruction.

**Syntax**

\[
\text{LDR}\{\text{cond}\}\{.W\} \ Rt, =\text{expr} \\
\text{LDR}\{\text{cond}\}\{.W\} \ Rt, =\text{label\_expr}
\]

where:

- \text{cond} is an optional condition code.
- \text{.W} is an optional instruction width specifier.
- \text{Rt} is the register to be loaded.
- \text{expr} evaluates to a numeric value.
- \text{label\_expr} is a PC-relative or external expression of an address in the form of a label plus or minus a numeric value.

**Usage**

When using the LDR pseudo-instruction:

- If the value of \text{expr} can be loaded with a valid MOV or MVN instruction, the assembler uses that instruction.
- If a valid MOV or MVN instruction cannot be used, or if the \text{label\_expr} syntax is used, the assembler places the constant in a literal pool and generates a PC-relative LDR instruction that reads the constant from the literal pool.

--- Note

- An address loaded in this way is fixed at link time, so the code is *not* position-independent.
- The address holding the constant remains valid regardless of where the linker places the ELF section containing the LDR instruction.

The assembler places the value of \text{label\_expr} in a literal pool and generates a PC-relative LDR instruction that loads the value from the literal pool.

If \text{label\_expr} is an external expression, or is not contained in the current section, the assembler places a linker relocation directive in the object file. The linker generates the address at link time.

If \text{label\_expr} is a local label, the assembler places a linker relocation directive in the object file and generates a symbol for that local label. The address is generated at link time. If the local label references Thumb code, the Thumb bit (bit 0) of the address is set.
The offset from the PC to the value in the literal pool must be less than ±4KB (ARM, 32-bit Thumb) or in the range 0 to +1KB (16-bit Thumb). You are responsible for ensuring that there is a literal pool within range.

If the label referenced is in Thumb code, the LDR pseudo-instruction sets the Thumb bit (bit 0) of label_expr.

___ Note ___
In RealView® Compilation Tools (RVCT) v2.2, the Thumb bit of the address was not set. If you have code that relies on this behavior, use the command line option --untyped_local_labels to force the assembler not to set the Thumb bit when referencing labels in Thumb code.

LDR in Thumb code

You can use the .W width specifier to force LDR to generate a 32-bit instruction in Thumb code on ARMv6T2 and above processors. LDR.W always generates a 32-bit instruction, even if the immediate value could be loaded in a 16-bit MOV, or there is a literal pool within reach of a 16-bit PC-relative load.

If the value to be loaded is not known in the first pass of the assembler, LDR without .W generates a 16-bit instruction in Thumb code, even if that results in a 16-bit PC-relative load for a value that could be generated in a 32-bit MOV or MVN instruction. However, if the value is known in the first pass, and it can be generated using a 32-bit MOV or MVN instruction, the MOV or MVN instruction is used.

The LDR pseudo-instruction never generates a 16-bit flag-setting MOV instruction. Use the --diag_warning 1727 assembler command line option to check when a 16-bit instruction could have been used.

You can use the MOV32 pseudo-instruction for generating immediate values or addresses without loading from a literal pool.

Examples

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDR r3,=0xff0</td>
<td>loads 0xff0 into R3</td>
</tr>
<tr>
<td>LDR r1,=0xffff</td>
<td>loads 0xffff into R1</td>
</tr>
<tr>
<td>LDR r2,=place</td>
<td>loads the address of place into R2</td>
</tr>
<tr>

- Condition codes on page 3-162.
3.13.4 UND pseudo-instruction

Generate an architecturally undefined instruction. An attempt to execute an undefined instruction causes the Undefined instruction exception. Architecturally undefined instructions are expected to remain undefined.

**Syntax**

UND{cond}{.W} {#expr}

where:

- **cond** is an optional condition code.
- **.W** is an optional instruction width specifier.
- **expr** evaluates to a numeric value. **Table 3-10** shows the range and encoding of **expr** in the instruction, where **Y** shows the locations of the bits that encode for **expr** and **V** is the 4 bits that encode for the condition code.
  
  If **expr** is omitted, the value 0 is used.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Encoding</th>
<th>Number of bits for expr</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARM</td>
<td>0xV7FYYYFY</td>
<td>16</td>
<td>0-65535</td>
</tr>
<tr>
<td>32-bit Thumb</td>
<td>0xF7FYAYFY</td>
<td>12</td>
<td>0-4095</td>
</tr>
<tr>
<td>16-bit Thumb</td>
<td>0xDEYY</td>
<td>8</td>
<td>0-255</td>
</tr>
</tbody>
</table>

**UND in Thumb code**

You can use the **.W** width specifier to force UND to generate a 32-bit instruction in Thumb code on ARMv6T2 and above processors. UND.**W** always generates a 32-bit instruction, even if **expr** is in the range 0-255.

**Disassembly**

The encodings that this pseudo-instruction produces disassemble to DCI.

4.2 Instructions shared by NEON and VFP

This section contains the following subsections:

- **VLDR and VSTR on page 4-7**
  Extension register load and store.

- **VLDM, VSTM, VPOP, and VPUSH on page 4-8**
  Extension register load and store multiple.

- **VMOV (between two ARM registers and an extension register) on page 4-9**
  Transfer contents between two ARM registers and a 64-bit extension register.

- **VMOV (between an ARM register and a NEON scalar) on page 4-10**
  Transfer contents between an ARM register and a half of a 64-bit extension register.

- **VMOV (between one ARM register and single precision VFP) on page 4-11**
  Transfer contents between a 32-bit extension register and an ARM register.

- **VMRS and VMSR on page 4-12**
  Transfer contents between an ARM register and a NEON and VFP system register.
4.2.1 VLDR and VSTR

Extension register load and store.

Syntax

VLDR{cond}{.size} Fd, [Rn[, #offset]]
VSTR{cond}{.size} Fd, [Rn[, #offset]]
VLDR{cond}{.size} Fd, label
VSTR{cond}{.size} Fd, label

where:
cond is an optional condition code.
size is an optional data size specifier. Must be 32 if Fd is an S register, or 64 otherwise.
Fd is the extension register to be loaded or saved. For a NEON instruction, it must be a D register. For a VFP instruction, it can be either a D or S register.
Rn is the ARM register holding the base address for the transfer.
offset is an optional numeric expression. It must evaluate to a numeric value at assembly time. The value must be a multiple of 4, and lie in the range –1020 to +1020. The value is added to the base address to form the address used for the transfer.
label is a PC-relative expression.
label must be aligned on a word boundary within ±1KB of the current instruction.

Usage

The VLDR instruction loads an extension register from memory. The VSTR instruction saves the contents of an extension register to memory.

One word is transferred if Fd is an S register (VFP only). Two words are transferred otherwise.

There is also an VLDR pseudo-instruction.

Condition codes on page 3-162

VLDR pseudo-instruction on page 4-68.
4.2.2 VLDM, VSTM, VPOP, and VPUSH

Extension register load multiple, store multiple, pop from stack, push onto stack.

Syntax

VLDM\(\text{mode} \{\text{cond}\}\ Rn[!], \text{Registers}\)
VSTM\(\text{mode} \{\text{cond}\}\ Rn[!], \text{Registers}\)
VPOP\{\text{cond}\} \text{Registers}\)
VPUSH\{\text{cond}\} \text{Registers}\)

where:

\(\text{mode}\) must be one of:

- IA meaning Increment address After each transfer. IA is the default, and can be omitted.
- DB meaning Decrement address Before each transfer.
- EA meaning Empty Ascending stack operation. This is the same as DB for loads, and the same as IA for saves.
- FD meaning Full Descending stack operation. This is the same as IA for loads, and the same as DB for saves.

\(\text{cond}\) is an optional condition code.

\(\text{Rn}\) is the ARM register holding the base address for the transfer.

\(!\) is optional. \(!\) specifies that the updated base address must be written back to \(\text{Rn}\). If \(!\) is not specified, \(\text{mode}\) must be \text{IA}.

\(\text{ Registers}\) is a list of consecutive extension registers enclosed in braces, \{ and \}. The list can be comma-separated, or in range format. There must be at least one register in the list.

You can specify S, D, or Q registers, but they must not be mixed. The number of registers must not exceed 16 D registers, or 8 Q registers. If Q registers are specified, on disassembly they are shown as D registers.

--- Note ---

\(\text{VPOP}\ \text{ Registers}\) is equivalent to \(\text{VLDM}\ sp!, \text{Registers}\).

\(\text{VPUSH}\ \text{ Registers}\) is equivalent to \(\text{VSTMDB}\ sp!, \text{Registers}\).

You can use either form of these instructions. They disassemble to \text{VPOP} and \text{VPUSH}.

See also

Concepts

Using the Assembler:

- Stack implementation using LDM and STM on page 5-22.

Reference

- Condition codes on page 3-162.
4.2.3 VMOV (between two ARM registers and an extension register)

Transfer contents between two ARM registers and a 64-bit extension register, or two consecutive 32-bit VFP registers.

Syntax

```
VMOV{cond} Dm, Rd, Rn
VMOV{cond} Rd, Rn, Dm
VMOV{cond} Sm, Sm1, Rd, Rn
VMOV{cond} Rd, Rn, Sm, Sm1
```

where:

- \( \text{cond} \) is an optional condition code.
- \( Dm \) is a 64-bit extension register.
- \( Sm \) is a VFP 32-bit register.
- \( Sm1 \) is the next consecutive VFP 32-bit register after \( Sm \).
- \( Rd, Rn \) are the ARM registers. \( Rd \) and \( Rn \) must not be PC.

Usage

- \( \text{VMOV } Dm, Rd, Rn \) transfers the contents of \( Rd \) into the low half of \( Dm \), and the contents of \( Rn \) into the high half of \( Dm \).
- \( \text{VMOV } Rd, Rn, Dm \) transfers the contents of the low half of \( Dm \) into \( Rd \), and the contents of the high half of \( Dm \) into \( Rn \).
- \( \text{VMOV } Rd, Rn, Sm, Sm1 \) transfers the contents of \( Sm \) into \( Rd \), and the contents of \( Sm1 \) into \( Rn \).
- \( \text{VMOV } Sm, Sm1, Rd, Rn \) transfers the contents of \( Rd \) into \( Sm \), and the contents of \( Rn \) into \( Sm1 \).

Architectures

The 64-bit instructions are available in:
- NEON
- VFPv2 and above.

The 2 x 32-bit instructions are available in VFPv2 and above.

See also

Reference

- Condition codes on page 3-162.
4.2.4 VMOV (between an ARM register and a NEON scalar)

Transfer contents between an ARM register and a NEON scalar.

**Syntax**

\[
\text{VMOV}\{\text{cond}\}\{.\text{size}\} \ Dn[x], Rd \\
\text{VMOV}\{\text{cond}\}\{.\text{datatype}\} \ Rd, Dn[x]
\]

where:

- \textit{cond} is an optional condition code.
- \textit{size} is the data size. Can be 8, 16, or 32. If omitted, size is 32. For VFP instructions, \textit{size} must be 32 or omitted.
- \textit{datatype} is the data type. Can be U8, S8, U16, S16, or 32. If omitted, \textit{datatype} is 32. For VFP instructions, \textit{datatype} must be 32 or omitted.
- \textit{Dn[x]} is the NEON scalar.
- \textit{Rd} is the ARM register. \textit{Rd} must not be PC.

**Usage**

\[
\text{VMOV} \ Rd, Dn[x] \text{ transfers the contents of } Dn[x] \text{ into the least significant byte, halfword, or word of } Rd. \text{ The remaining bits of } Rd \text{ are either zero or sign extended.} \\
\text{VMOV} \ Dn[x], \ Rd \text{ transfers the contents of the least significant byte, halfword, or word of } Rd \text{ into } Dn[x].
\]

**See also**

**Concepts**

\textit{Using the Assembler:}

- \textit{NEON scalars on page 9-20.}

**Reference**

- \textit{Condition codes on page 3-162.}
4.2.5 VMOV (between one ARM register and single precision VFP)

Transfer contents between a single-precision floating-point register and an ARM register.

Syntax

\[
\text{VMOV}\{\text{cond}\} \quad R_d, \quad S_n \\
\text{VMOV}\{\text{cond}\} \quad S_n, \quad R_d
\]

where:

- \(\text{cond}\) is an optional condition code.
- \(S_n\) is the VFP single-precision register.
- \(R_d\) is the ARM register. \(R_d\) must not be PC.

Usage

\[
\text{VMOV} \quad R_d, \quad S_n \text{ transfers the contents of } S_n \text{ into } R_d. \\
\text{VMOV} \quad S_n, \quad R_d \text{ transfers the contents of } R_d \text{ into } S_n.
\]

See also

Reference

- *Condition codes on page 3-162.*
4.2.6 VMRS and VMSR

Transfer contents between an ARM register and a NEON and VFP system register.

**Syntax**

\[
\begin{align*}
\text{VMRS} & \{\text{cond}\} \ Rd, \ extsysreg \\
\text{VMSR} & \{\text{cond}\} \ extsysreg, \ Rd \\
\end{align*}
\]

where:

- `cond` is an optional condition code.
- `extsysreg` is the NEON and VFP system register, usually FPSCR, FPSID, or FPEXC.
- `Rd` is the ARM register. `Rd` must not be PC.

It can be APSR_nzcv, if `extsysreg` is FPSCR. In this case, the floating-point status flags are transferred into the corresponding flags in the ARM APSR.

**Usage**

The VMRS instruction transfers the contents of `extsysreg` into `Rd`. The VMSR instruction transfers the contents of `Rd` into `extsysreg`.

---

**Note**

These instructions stall the ARM until all current NEON or VFP operations complete.

---

**Examples**

- `VMRS r2, FPCID`
- `VMRS APSR_nzcv, FPSCR ; transfer FP status register to ARM APSR`
- `VMSR FPSCR, r4`

4.3 NEON logical and compare operations

This section contains the following subsections:

- **VAND, VBIC, VEOR, VORN, and VORR (register)** on page 4-14
  Bitwise AND, Bit Clear, Exclusive OR, OR Not, and OR (register).

- **VBIC and VORR (immediate)** on page 4-15
  Bitwise Bit Clear and OR (immediate).

- **VBIF, VBIT, and VBSL** on page 4-16
  Bitwise Insert if False, Insert if True, and Select.

- **VMOV, VMVN (register)** on page 4-17
  Move, and Move NOT.

- **VACGE and VACGT** on page 4-18
  Compare Absolute.

- **VCEQ, VCGE, VCGT, VCLE, and VCLT** on page 4-19
  Compare.

- **VTST** on page 4-20
  Test bits.
4.3.1 VAND, VBIC, VEOR, VORN, and VORR (register)

**VAND** (Bitwise AND), **VBIC** (Bit Clear), **VEOR** (Bitwise Exclusive OR), **VORN** (Bitwise OR NOT), and **VORR** (Bitwise OR) instructions perform bitwise logical operations between two registers, and place the results in the destination register.

**Syntax**

\[ V_{op}\{ \text{cond}\}\{.\text{datatype}\}\{Q_d, Q_n, Q_m\} \]

\[ V_{op}\{\text{cond}\}\{.\text{datatype}\}\{D_d, D_n, D_m\} \]

where:

- \( op \) must be one of:
  - AND Logical AND
  - ORR Logical OR
  - EOR Logical exclusive OR
  - BIC Logical AND complement
  - ORN Logical OR complement.

- \( \text{cond} \) is an optional condition code.

- \( \text{datatype} \) is an optional data type. The assembler ignores \( \text{datatype} \).

- \( Q_d, Q_n, Q_m \) specifies the destination register, the first operand register, and the second operand register, for a quadword operation.

- \( D_d, D_n, D_m \) specifies the destination register, the first operand register, and the second operand register, for a doubleword operation.

---

**Note**

VORR with the same register for both operands is a VMOV instruction. You can use VORR in this way, but disassembly of the resulting code produces the VMOV syntax.

---

**See also**

**Reference**

- *VMOV, VMVN (register)* on page 4-17
- *Condition codes* on page 3-162.
4.3.2 VBIC and VORR (immediate)

VBIC (Bit Clear immediate) takes each element of the destination vector, performs a bitwise AND Complement with an immediate value, and returns the result into the destination vector.

VORR (Bitwise OR immediate) takes each element of the destination vector, performs a bitwise OR with an immediate value, and returns the result into the destination vector.

Syntax

\[ \text{Vop}\{\text{cond}\}.\text{datatype Qd}, \#imm} \]
\[ \text{Vop}\{\text{cond}\}.\text{datatype Dd}, \#imm} \]

where:

- \( \text{op} \) must be either BIC or ORR.
- \( \text{cond} \) is an optional condition code.
- \( \text{datatype} \) must be either I8, I16, I32, or I64.
- \( \text{Qd or Dd} \) is the NEON register for the source and result.
- \( \text{imm} \) is the immediate value.

Immediate values

You can either specify \( \text{imm} \) as a pattern which the assembler repeats to fill the destination register, or you can directly specify the immediate value (that conforms to the pattern) in full. The pattern for \( \text{imm} \) depends on \( \text{datatype} \) as shown in Table 4-4:

<table>
<thead>
<tr>
<th>( \text{I16} )</th>
<th>( \text{I32} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00XY</td>
<td>0x000000XY</td>
</tr>
<tr>
<td>0xXY00</td>
<td>0x0000XY00</td>
</tr>
<tr>
<td></td>
<td>0x00XY0000</td>
</tr>
<tr>
<td></td>
<td>0xXY000000</td>
</tr>
</tbody>
</table>

If you use the I8 or I64 datatypes, the assembler will convert it to either the I16 or I32 instruction to match the pattern of \( \text{imm} \). If the immediate value does not match any of the patterns in Table 4-4, the assembler generates an error.

See also

Reference

- \( VAND \) and \( VORN \) (immediate) on page 4-71
- \( \text{Condition codes} \) on page 3-162.
4.3.3 VBIT, VBIF, and VBSL

VBIT (Bitwise Insert if True) inserts each bit from the first operand into the destination if the corresponding bit of the second operand is 1, otherwise leaves the destination bit unchanged.

VBIF (Bitwise Insert if False) inserts each bit from the first operand into the destination if the corresponding bit of the second operand is 0, otherwise leaves the destination bit unchanged.

VBSL (Bitwise Select) selects each bit for the destination from the first operand if the corresponding bit of the destination is 1, or from the second operand if the corresponding bit of the destination is 0.

Syntax

\[
Vop\{\text{cond}\}\{\text{datatype}\} \{Qd\}, \ Qn, \ Qm
\]

\[
Vop\{\text{cond}\}\{\text{datatype}\} \{Dd\}, \ Dn, \ Dm
\]

where:

- \(op\) must be one of BIT, BIF, or BSL.
- \(cond\) is an optional condition code.
- \(datatype\) is an optional datatype. The assembler ignores \(datatype\).
- \(Qd, Qn, Qm\) specifies the destination register, the first operand register, and the second operand register, for a quadword operation.
- \(Dd, Dn, Dm\) specifies the destination register, the first operand register, and the second operand register, for a doubleword operation.

See also

Reference

- *Condition codes on page 3-162.*
4.3.4 VMOV, VMVN (register)

Vector Move (register) copies a value from the source register into the destination register.

Vector Move Not (register) inverts the value of each bit from the source register and places the results into the destination register.

Syntax

\[
\begin{align*}
\text{VMOV} & \{\text{cond}\} \{\text{datatype}\} \ Q_d, \ Q_m \\
\text{VMOV} & \{\text{cond}\} \{\text{datatype}\} \ D_d, \ D_m \\
\text{VMVN} & \{\text{cond}\} \{\text{datatype}\} \ Q_d, \ Q_m \\
\text{VMVN} & \{\text{cond}\} \{\text{datatype}\} \ D_d, \ D_m \\
\end{align*}
\]

where:

- \text{cond} is an optional condition code.
- \text{datatype} is an optional datatype. The assembler ignores \text{datatype}.
- \(Q_d, \ Q_m\) specifies the destination vector and the source vector, for a quadword operation.
- \(D_d, \ D_m\) specifies the destination vector and the source vector, for a doubleword operation.

See also

Reference

- Condition codes on page 3-162.
4.3.5 VACGE and VACGT

Vector Absolute Compare takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the condition is true, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

Syntax

VAC\{cond\}.F32 \{Qd\}, Qn, Qm
VAC\{cond\}.F32 \{Dd\}, Dn, Dm

where:

- \textit{op} must be one of:
  - GE: Absolute Greater than or Equal
  - GT: Absolute Greater Than.
- \textit{cond} is an optional condition code.
- Qd, Qn, Qm specifies the destination register, the first operand register, and the second operand register, for a quadword operation.
- Dd, Dn, Dm specifies the destination register, the first operand register, and the second operand register, for a doubleword operation.

The result datatype is I32.

See also

Reference

- \textit{VACLE and VACLT} on page 4-72
- \textit{Condition codes} on page 3-162.
4.3.6 VCEQ, VCGE, VCGT, VCLE, and VCLT

Vector Compare takes the value of each element in a vector, and compares it with the value of
the corresponding element of a second vector, or zero. If the condition is true, the corresponding
element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

**Syntax**

\[
\text{VC} \\text{op} \{\text{cond}\}.\text{datatype} \{Qd\}, \ Qn, \ Qm \\
\text{VC} \\text{op} \{\text{cond}\}.\text{datatype} \{Dd\}, \ Dn, \ Dm \\
\text{VC} \\text{op} \{\text{cond}\}.\text{datatype} \{Qd\}, \ Qn, \ #0 \\
\text{VC} \\text{op} \{\text{cond}\}.\text{datatype} \{Dd\}, \ Dn, \ #0
\]

where:

- \( \text{op} \) must be one of:
  - EQ \quad \text{Equal}
  - GE \quad \text{Greater than or Equal}
  - GT \quad \text{Greater Than}
  - LE \quad \text{Less than or Equal (only if the second operand is \#0)}
  - LT \quad \text{Less Than (only if the second operand is \#0)}.

- \( \text{cond} \) is an optional condition code.

- \( \text{datatype} \) must be one of:
  - I8, I16, I32, or F32 for EQ
  - S8, S16, S32, U8, U16, U32, or F32 for GE, GT, LE, or LT (except \#0 form)
  - S8, S16, S32, or F32 for GE, GT, LE, or LT (\#0 form).

The result datatype is:

- I32 for operand datatypes I32, S32, U32, or F32
- I16 for operand datatypes I16, S16, or U16
- I8 for operand datatypes I8, S8, or U8.

\( Qd, \ Qn, \ Qm \) specifies the destination register, the first operand register, and the second
operand register, for a quadword operation.

\( Dd, \ Dn, \ Dm \) specifies the destination register, the first operand register, and the second
operand register, for a doubleword operation.

\#0 replaces \( Qm \) or \( Dm \) for comparisons with zero.

**See also**

**Reference**

- \textit{VCLE and VCLT} on page 4-73
- \textit{Condition codes} on page 3-162.
4.3.7 VTST

VTST (Vector Test Bits) takes each element in a vector, and bitwise logical ANDs them with the corresponding element of a second vector. If the result is not zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

Syntax

VTST{cond}.size {Qd}, Qn, Qm
VTST{cond}.size {Dd}, Dn, Dm

where:

cond is an optional condition code.

size must be one of 8, 16, or 32.

Qd, Qn, Qm specifies the destination register, the first operand register, and the second operand register, for a quadword operation.

Dd, Dn, Dm specifies the destination register, the first operand register, and the second operand register, for a doubleword operation.

4.4 NEON general data processing instructions

This section contains the following subsections:

- **VCVT (between fixed-point or integer, and floating-point)** on page 4-22
  Vector convert between fixed-point or integer and floating-point.

- **VCVT (between half-precision and single-precision floating-point)** on page 4-23
  Vector convert between half-precision and single-precision floating-point.

- **VDUP** on page 4-24
  Duplicate scalar to all lanes of vector.

- **VEXT** on page 4-25
  Extract.

- **VMOV, VMVN (immediate)** on page 4-26
  Move and Move Negative (immediate).

- **VMOVL, V{Q}MOVN, VQMOVUN** on page 4-27
  Move (register).

- **VREV** on page 4-28
  Reverse elements within a vector.

- **VSWP** on page 4-29
  Swap vectors.

- **VTLB, VTBX** on page 4-30
  Vector table look-up.

- **VTRN** on page 4-31
  Vector transpose.

- **VUZP, VZIP** on page 4-32
  Vector interleave and de-interleave.
4.4.1 VCVT (between fixed-point or integer, and floating-point)

VCVT (Vector Convert) converts each element in a vector in one of the following ways, and places the results in the destination vector:

• from floating-point to integer
• from integer to floating-point
• from floating-point to fixed-point
• from fixed-point to floating-point.

Syntax

VCVT{cond}.type Qd, Qm {, #fbits}
VCVT{cond}.type Dd, Dm {, #fbits}

where:

cond is an optional condition code.

type specifies the data types for the elements of the vectors. It must be one of:

- S32.F32 floating-point to signed integer or fixed-point
- U32.F32 floating-point to unsigned integer or fixed-point
- F32.S32 signed integer or fixed-point to floating-point
- F32.U32 unsigned integer or fixed-point to floating-point

Qd, Qm specifies the destination vector and the operand vector, for a quadword operation.

Dd, Dm specifies the destination vector and the operand vector, for a doubleword operation.

fbits if present, specifies the number of fraction bits in the fixed point number. Otherwise, the conversion is between floating-point and integer. fbits must lie in the range 0-32. If fbites is omitted, the number of fraction bits is 0.

Rounding

Integer or fixed-point to floating-point conversions use round to nearest.

Floating-point to integer or fixed-point conversions use round towards zero.

See also

Reference

- Condition codes on page 3-162.
4.4.2 VCVT (between half-precision and single-precision floating-point)

VCVT (Vector Convert), with half-precision extension, converts each element in a vector in one of the following ways, and places the results in the destination vector:

- from half-precision floating-point to single-precision floating-point (F32.F16)
- from single-precision floating-point to half-precision floating-point (F16.F32).

Syntax

VCVT{cond}.F32.F16 Qd, Dm
VCVT{cond}.F16.F32 Dd, Qm

where:

cond is an optional condition code.
Qd, Dm specifies the destination vector for the single-precision results and the half-precision operand vector.
Dd, Qm specifies the destination vector for half-precision results and the single-precision operand vector.

Architectures

This instruction is only available in NEON systems with the half-precision extension.

See also

Reference

• Condition codes on page 3-162.
4.4.3 VDUP

VDUP (Vector Duplicate) duplicates a scalar into every element of the destination vector. The source can be a NEON scalar or an ARM register.

Syntax

VDUP{cond}.size Qd, Dm[x]
VDUP{cond}.size Dd, Dm[x]
VDUP{cond}.size Qd, Rm
VDUP{cond}.size Dd, Rm

where:

cond is an optional condition code.
size must be 8, 16, or 32.
Qd specifies the destination register for a quadword operation.
Dd specifies the destination register for a doubleword operation.
Dm[x] specifies the NEON scalar.
Rm specifies the ARM register. \( Rm \) must not be the R15.

See also

Reference

- *Condition codes on page 3-162.*
4.4.4 VEXT

VEXT (Vector Extract) extracts 8-bit elements from the bottom end of the second operand vector and the top end of the first, concatenates them, and places the result in the destination vector. See Figure 4-1 for an example.

![Figure 4-1 Operation of doubleword VEXT for imm = 3](image)

**Syntax**

VEXT\{cond\}.8 \{Qd\}, Qn, Qm, \#imm

VEXT\{cond\}.8 \{Dd\}, Dn, Dm, \#imm

where:

- cond is an optional condition code.
- Qd, Qn, Qm specifies the destination register, the first operand register, and the second operand register, for a quadword operation.
- Dd, Dn, Dm specifies the destination register, the first operand register, and the second operand register, for a doubleword operation.
- \#imm is the number of 8-bit elements to extract from the bottom of the second operand vector, in the range 0-7 for doubleword operations, or 0-15 for quadword operations.

**VEXT pseudo-instruction**

You can specify a datatype of 16, 32, or 64 instead of 8. In this case, \#imm refers to halfwords, words, or doublewords instead of referring to bytes, and the permitted ranges are correspondingly reduced.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.4.5 VMOV, VMVN (immediate)

VMOV (Vector Move) and VMVN (Vector Move Negative) immediate generate an immediate value into the destination register.

Syntax

\[ Vop\{cond\}.datatype Qd, \#imm \]
\[ Vop\{cond\}.datatype Dd, \#imm \]

where:

- \( op \) must be either MOV or MVN.
- \( cond \) is an optional condition code.
- \( datatype \) must be one of I8, I16, I32, I64, or F32.
- \( Qd \) or \( Dd \) is the NEON register for the result.
- \( imm \) is an immediate value of the type specified by \( datatype \). This is replicated to fill the destination register.

<table>
<thead>
<tr>
<th>datatype</th>
<th>VMOV</th>
<th>VMVN</th>
</tr>
</thead>
<tbody>
<tr>
<td>I8</td>
<td>0xXY</td>
<td>-</td>
</tr>
<tr>
<td>I16</td>
<td>0x00XY, 0xXY00</td>
<td>0xFFXY, 0xXYFF</td>
</tr>
<tr>
<td>I32</td>
<td>0x000000XY, 0x0000XY00, 0x0000XY000, 0x00XY0000</td>
<td>0xFFFFFXY, 0xFFFFXYFF, 0xFFFFYFF, 0xXYYYYYYYY</td>
</tr>
<tr>
<td></td>
<td>0x000XYFF, 0x00XYFFFF</td>
<td>0xFFFFXY00, 0xXYY0000</td>
</tr>
<tr>
<td>I64</td>
<td>byte masks, 0xGGHHJJKKLLMMNNPP a</td>
<td>-</td>
</tr>
<tr>
<td>F32</td>
<td>floating-point numbers b</td>
<td>-</td>
</tr>
</tbody>
</table>

- a. Each of 0xGG, 0xHH, 0xJJ, 0xKK, 0xLL, 0xMM, 0xNN, and 0xPP must be either 0x00 or 0xFF.
- b. Any number that can be expressed as \( +/-n \times 2^{-r} \), where \( n \) and \( r \) are integers, 16 <= \( n \) <= 31, 0 <= \( r \) <= 7.

See also

Reference

- Condition codes on page 3-162.
4.4.6 VMOVL, V{Q}MOVN, VQMOVUN

VMOVL (Vector Move Long) takes each element in a doubleword vector, sign or zero extends them to twice their original length, and places the results in a quadword vector.

VMOVN (Vector Move and Narrow) copies the least significant half of each element of a quadword vector into the corresponding elements of a doubleword vector.

VQMOVN (Vector Saturating Move and Narrow) copies each element of the operand vector to the corresponding element of the destination vector. The result element is half the width of the operand element, and values are saturated to the result width.

VQMOVUN (Vector Saturating Move and Narrow, signed operand with Unsigned result) copies each element of the operand vector to the corresponding element of the destination vector. The result element is half the width of the operand element, and values are saturated to the result width.

Syntax

\[ \text{VMOVL} \{\text{cond}\} . \text{datatype} \ Qd, \ Dm \]
\[ \text{V}{\text{Q}}\text{MOVN}\{\text{cond}\} . \text{datatype} \ Dd, \ Qm \]
\[ \text{VQMOVUN}\{\text{cond}\} . \text{datatype} \ Dd, \ Qm \]

where:

- \( Q \) if present, specifies that the results are saturated.
- \( \text{cond} \) is an optional condition code.
- \( \text{datatype} \) must be one of:
  - S8, S16, S32 for VMOVL
  - U8, U16, U62 for VMOVL
  - I16, I32, I64 for VMOVN
  - S16, S32, S64 for VQMOVN or VQMOVUN
  - U16, U32, U64 for VQMOVN.

- \( Qd, Dm \) specifies the destination vector and the operand vector for VMOVL.
- \( Dd, Qm \) specifies the destination vector and the operand vector for VQMOVU.

See also

Reference

- Condition codes on page 3-162.
4.4.7 VREV

VREV16 (Vector Reverse within halfwords) reverses the order of 8-bit elements within each halfword of the vector, and places the result in the corresponding destination vector.

VREV32 (Vector Reverse within words) reverses the order of 8-bit or 16-bit elements within each word of the vector, and places the result in the corresponding destination vector.

VREV64 (Vector Reverse within doublewords) reverses the order of 8-bit, 16-bit, or 32-bit elements within each doubleword of the vector, and places the result in the corresponding destination vector.

Syntax

\[ \text{VREVn} \{\text{cond}\} . \text{size} \ Qd, \ Qm \]
\[ \text{VREVn} \{\text{cond}\} . \text{size} \ Dd, \ Dm \]

where:

\[ n \] must be one of 16, 32, or 64.
\[ \text{cond} \] is an optional condition code.
\[ \text{size} \] must be one of 8, 16, or 32, and must be less than \[ n \].
\[ Qd, \ Qm \] specifies the destination vector and the operand vector, for a quadword operation.
\[ Dd, \ Dm \] specifies the destination vector and the operand vector, for a doubleword operation.

See also

Reference

- \textit{Condition codes on page 3-162}. 
4.4.8 VSWP

VSWP (Vector Swap) exchanges the contents of two vectors. The vectors can be either doubleword or quadword. There is no distinction between data types.

Syntax

\[
\text{VSWP}\{\text{cond}\}\{\text{.datatype}\} \ Qd, \ Qm \\
\text{VSWP}\{\text{cond}\}\{\text{.datatype}\} \ Dd, \ Dm
\]

where:

- \text{cond} is an optional condition code.
- \text{datatype} is an optional datatype. The assembler ignores \text{datatype}.
- \text{Qd}, \text{Qm} specifies the vectors for a quadword operation.
- \text{Dd}, \text{Dm} specifies the vectors for a doubleword operation.

See also

Reference

- Condition codes on page 3-162.
4.4.9 VTBL, VTBX

VTBL (Vector Table Lookup) uses byte indexes in a control vector to look up byte values in a table and generate a new vector. Indexes out of range return 0.

VTBX (Vector Table Extension) works in the same way, except that indexes out of range leave the destination element unchanged.

**Syntax**

\[ V^{op}\{cond\}.8\ Dd,\ list,\ Dm \]

where:

- **op** must be either TBL or TBX.
- **cond** is an optional condition code.
- **Dd** specifies the destination vector.
- **list** Specifies the vectors containing the table. It must be one of:
  - \{Dn\}
  - \{Dn,D(n+1)\}
  - \{Dn,D(n+1),D(n+2)\}
  - \{Dn,D(n+1),D(n+2),D(n+3)\}
  - \{Qn,Q(n+1)\}.

All the registers in **list** must be in the range \(D0-D31\) or \(Q0-Q15\) and must not wrap around the end of the register bank. For example \{D31,D0,D1\} is not permitted. If **list** contains Q registers, they disassemble to the equivalent D registers.

- **Dm** specifies the index vector.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.4.10 VTRN

VTRN (Vector Transpose) treats the elements of its operand vectors as elements of 2 x 2 matrices, and transposes the matrices. Figure 4-2 and Figure 4-3 show examples of the operation of VTRN.

![Figure 4-2 Operation of doubleword VTRN.8](image1)

![Figure 4-3 Operation of doubleword VTRN.32](image2)

**Syntax**

\[
\text{VTRN}\{\text{cond}\} \cdot \text{size} \ Qd, \ Qm \\
\text{VTRN}\{\text{cond}\} \cdot \text{size} \ Dd, \ Dm
\]

where:

- \textit{cond} is an optional condition code.
- \textit{size} must be one of 8, 16, or 32.
- \textit{Qd}, \textit{Qm} specifies the vectors, for a quadword operation.
- \textit{Dd}, \textit{Dm} specifies the vectors, for a doubleword operation.

**See also**

**Reference**

- \textit{Condition codes} on page 3-162.
4.4.11 VUZP, VZIP

VZIP (Vector Zip) interleaves the elements of two vectors.

VUZP (Vector Unzip) de-interleaves the elements of two vectors.

De-interleaving is the inverse process of interleaving.

Table 4-9 Operation of quadword VUZP.32

Syntax

Vop{cond}.size Qd, Qm
Vop{cond}.size Dd, Dm

where:

op must be either UZP or ZIP.
cond is an optional condition code.
size must be one of 8, 16, or 32.
Qd, Qm specifies the vectors, for a quadword operation.
Dd, Dm specifies the vectors, for a doubleword operation.

Note
The following are all the same instruction:

* VZIP.32 Dd, Dm
• VUZP.32 \( Dd, Dm \)
• VTRN.32 \( Dd, Dm \)

The instruction is disassembled as VTRN.32 \( Dd, Dm \).

4.5 NEON shift instructions

This section contains the following subsections:

- **VSHL, VQSHL, VQSHLU, and VSHLL (by immediate)** on page 4-35
  Shift Left by immediate value.

- **V{Q}{R}SHL (by signed variable)** on page 4-36
  Shift left by signed variable.

- **V{R}SHR{N}, V{R}SRA (by immediate)** on page 4-37
  Shift Right by immediate value.

- **VQ{R}SHR{U}N (by immediate)** on page 4-38
  Shift Right by immediate value, and saturate.

- **VSLI and VSRI** on page 4-39
  Shift Left and Insert, and Shift Right and Insert.
4.5.1 VSHL, VQSHL, VQSHLU, and VSHLL (by immediate)

Vector Shift Left (by immediate) instructions take each element in a vector of integers, left shift them by an immediate value, and place the results in the destination vector.

For VSHL (Vector Shift Left), bits shifted out of the left of each element are lost.

For VQSHL (Vector Saturating Shift Left) and VQSHLU (Vector Saturating Shift Left Unsigned), the sticky QC flag (FPSCR bit[27]) is set if saturation occurs.

For VSHLL (Vector Shift Left Long), values are sign or zero extended.

Syntax

\[
\text{V\{Q\}SHL\{U\}\{cond\}.datatype \{Qd}, Qm, \#imm}
\]

\[
\text{V\{Q\}SHL\{U\}\{cond\}.datatype \{Dd}, Dm, \#imm}
\]

\[
\text{VSHLL\{cond\}.datatype Qd, Dm, \#imm}
\]

where:

Q if present, indicates that if any of the results overflow, they are saturated.

U only permitted if Q is also present. Indicates that the results are unsigned even though the operands are signed.

cond is an optional condition code.

datatype must be one of:

\[
\text{I8, I16, I32, I64 for VSHL}
\]

\[
\text{S8, S16, S32 for VSHLL, VQSHL, or VQSHLU}
\]

\[
\text{U8, U16, U32 for VSHLL or VQSHL}
\]

\[
\text{S64 for VQSHL or VQSHLU}
\]

\[
\text{U64 for VQSHL.}
\]

Qd, Qm are the destination and operand vectors, for a quadword operation.

Dd, Dm are the destination and operand vectors, for a doubleword operation.

Qd, Dm are the destination and operand vectors, for a long operation.

imm is the immediate value specifying the size of the shift, in the range:

* 1 to size(datatype) for VSHLL
* 1 to (size(datatype) – 1) for VSHL, VQSHL, or VQSHLU.

0 is permitted, but the resulting code disassembles to VMOV or VMOVL.

See also

Reference

*  Condition codes on page 3-162. 
4.5.2  \textit{V}\{Q\}{R}SHL (by signed variable)

\textit{V}\text{SHL} (Vector Shift Left by signed variable) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results can be optionally saturated, rounded, or both. The sticky QC flag (FPSCR bit[27]) is set if saturation occurs.

**Syntax**

\[
\begin{align*}
\text{V}\{Q\}{R}\text{SHL}\{\text{cond}\} & . \text{datatype} \ \{Qd\}, \ Qm, \ Qn \\
\text{V}\{Q\}{R}\text{SHL}\{\text{cond}\} & . \text{datatype} \ \{Dd\}, \ Dm, \ Dn
\end{align*}
\]

where:

- \(Q\) if present, indicates that if any of the results overflow, they are saturated.
- \(R\) if present, indicates that each result is rounded. Otherwise, each result is truncated.
- \(\text{cond}\) is an optional condition code.
- \text{datatype} must be one of S8, S16, S32, S64, U8, U16, U32, or U64.
- \(Qd, \ Qm, \ Qn\) are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- \(Dd, \ Dm, \ Dn\) are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.5.3 V{R}SHR{N}, V{R}SRA (by immediate)

V{R}SHR{N} (Vector Shift Right by immediate value) takes each element in a vector, right shifts them by an immediate value, and places the results in the destination vector. The results can be optionally rounded, or narrowed, or both.

V{R}SRA (Vector Shift Right by immediate value and Accumulate) takes each element in a vector, right shifts them by an immediate value, and accumulates the results into the destination vector. The results can be optionally rounded.

Syntax

V{R}SHR{cond}.datatype {Qd}, Qm, #imm
V{R}SHR{cond}.datatype {Dd}, Dm, #imm
V{R}SRA{cond}.datatype {Qd}, Qm, #imm
V{R}SRA{cond}.datatype {Dd}, Dm, #imm
V{R}SHRN{cond}.datatype Dd, Qm, #imm

where:

R if present, indicates that the results are rounded. Otherwise, the results are truncated.
cond is an optional condition code.
datatype must be one of:
S8, S16, S32, S64 for V{R}SHR or V{R}SRA
U8, U16, U32, U64 for V{R}SHR or V{R}SRA
I16, I32, I64 for V{R}SHRN.

Qd, Qm are the destination vector and the operand vector, for a quadword operation.
Dd, Dm are the destination vector and the operand vector, for a doubleword operation.
Dd, Qm are the destination vector and the operand vector, for a narrow operation.
imm is the immediate value specifying the size of the shift, in the range 0 to (size(datatype) – 1).

See also

Reference

• Condition codes on page 3-162.
4.5.4 VQ(R)SHR(U)N (by immediate)

VQ(R)SHR(U)N (Vector Saturating Shift Right, Narrow, by immediate value, with optional Rounding) takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the results in a doubleword vector.

The sticky QC flag (FPSCR bit[27]) is set if saturation occurs.

**Syntax**

VQ(R)SHR(U)N{cond}.datatype Dd, Qm, #imm

where:

- **R** if present, indicates that the results are rounded. Otherwise, the results are truncated.
- **U** if present, indicates that the results are unsigned, although the operands are signed. Otherwise, the results are the same type as the operands.
- **cond** is an optional condition code.
- **datatype** must be one of:
  - S16, S32, S64 for VQ(R)SHRN or VQ(R)SHRUN
  - U16, U32, U64 for VQ(R)SHRN only.
- **Dd, Qm** are the destination vector and the operand vector.
- **imm** is the immediate value specifying the size of the shift, in the range 0 to (size(datatype) – 1).

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.5.5 VSLI and VSRI

**VSLI** (Vector Shift Left and Insert) takes each element in a vector, left shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the left of each element are lost.

**VSRI** (Vector Shift Right and Insert) takes each element in a vector, right shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the right of each element are lost.

![Figure 4-4 Operation of quadword VSLI.64 Qd, Qm, #1](image)

![Figure 4-5 Operation of doubleword VSRI.64 Dd, Dm, #2](image)

**Syntax**

\[
V_{op}\{cond\}.size\{Qd\},Qm,\#imm
\]

\[
V_{op}\{cond\}.size\{Dd\},Dm,\#imm
\]

where:

- **op** must be either SLI or SRI.
- **cond** is an optional condition code.
- **size** must be one of 8, 16, 32, or 64.
- **Qd**, **Qm** are the destination vector and the operand vector, for a quadword operation.
- **Dd**, **Dm** are the destination vector and the operand vector, for a doubleword operation.
- **imm** is the immediate value specifying the size of the shift, in the range:
  - 0 to \(size - 1\) for VSLI
  - 1 to \(size\) for VSRI.

**See also**

**Reference**
- *Condition codes* on page 3-162.
4.6 NEON general arithmetic instructions

This section contains the following subsections:

- **VABA{L} and VABD{L} on page 4-41**
  Vector Absolute Difference and Accumulate, and Absolute Difference.

- **V{Q}ABS and V{Q}NEG on page 4-42**
  Vector Absolute value, and Negate.

- **V{Q}ADD, VADDL, VADDW, V{Q}SUB, VSUBL, and VSUBW on page 4-43**
  Vector Add and Subtract.

- **V{R}ADDHN and V{R}SUBHN on page 4-44**
  Vector Add selecting High half, and Subtract selecting High Half.

- **V{R}HADD and VHSUB on page 4-45**
  Vector Halving Add and Subtract.

- **VPADD{L}, VPADAL on page 4-46**
  Vector Pairwise Add, Add and Accumulate.

- **VMAX, VMIN, VPMAX, and VPMIN on page 4-48**
  Vector Maximum, Minimum, Pairwise Maximum, and Pairwise Minimum.

- **VCLS, VCLZ, and VCNT on page 4-49**
  Vector Count Leading Sign bits, Count Leading Zeros, and Count set bits.

- **VRECPE and VRSQRT on page 4-50**
  Vector Reciprocal Estimate and Reciprocal Square Root Estimate.

- **VRECPS and VRSQRTS on page 4-51**
  Vector Reciprocal Step and Reciprocal Square Root Step.
4.6.1 VABA{L} and VABD{L}

VABA (Vector Absolute Difference and Accumulate) subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

VABD (Vector Absolute Difference) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results into the elements of the destination vector.

Long versions of both instructions are available.

Syntax

\( Vop\{cond\}.\text{datatype} \{Qd\}, \ Qn, \ Qm \)
\( Vop\{cond\}.\text{datatype} \{Dd\}, \ Dn, \ Dm \)
\( VopL\{cond\}.\text{datatype} \ Qd, \ Dn, \ Dm \)

where:

- \( op \) must be either ABA or ABD.
- \( cond \) is an optional condition code.
- \( datatype \) must be one of:
  - S8, S16, S32, U8, U16, or U32 for VABA, VABAL, or VABDL
  - S8, S16, S32, U8, U16, U32, or F32 for VABD.

- \( Qd, \ Qn, \ Qm \) are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- \( Dd, \ Dn, \ Dm \) are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.
- \( Qd, \ Dn, \ Dm \) are the destination vector, the first operand vector, and the second operand vector, for a long operation.

See also

Reference

- Condition codes on page 3-162.
4.6.2  V{Q}ABS and V{Q}NEG

VABS (Vector Absolute) takes the absolute value of each element in a vector, and places the results in a second vector. (The floating-point version only clears the sign bit.)

VNEG (Vector Negate) negates each element in a vector, and places the results in a second vector. (The floating-point version only inverts the sign bit.)

Saturating versions of both instructions are available. The sticky QC flag (FPSCR bit[27]) is set if saturation occurs.

Syntax

\[
\begin{align*}
\text{V\{Q\}op\{cond\}}.\text{datatype Qd, Qm} \\
\text{V\{Q\}op\{cond\}}.\text{datatype Dd, Dm}
\end{align*}
\]

where:

- \(Q\) if present, indicates that if any of the results overflow, they are saturated.
- \(op\) must be either ABS or NEG.
- \(cond\) is an optional condition code.
- \(datatype\) must be one of:
  - S8, S16, S32 for VABS, VNEG, VQABS, or VQNEG
  - F32 for VABS and VNEG only.

- \(Qd, Qm\) are the destination vector and the operand vector, for a quadword operation.
- \(Dd, Dm\) are the destination vector and the operand vector, for a doubleword operation.

See also

Reference

- Condition codes on page 3-162.
4.6.3 \texttt{V\{Q\}ADD, VADDL, VADDW, V\{Q\}SUB, VSUBL, and VSUBW}

\texttt{VADD} (Vector Add) adds corresponding elements in two vectors, and places the results in the destination vector.

\texttt{VSUB} (Vector Subtract) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

\texttt{VADD} and \texttt{VSUB} have these forms:

- Saturating. The sticky QC flag (FPSCR bit[27]) is set if saturation occurs.
- Long.
- Wide.

\textbf{Syntax}

\begin{verbatim}
V\{Q\}op\{cond\}.datatype \{Qd\}, Qn, Qm ; Saturating instruction
V\{Q\}op\{cond\}.datatype \{Dd\}, Dn, Dm ; Saturating instruction
VopL\{cond\}.datatype Qd, Dn, Dm ; Long instruction
VopW\{cond\}.datatype \{Qd\}, Qn, Dm ; Wide instruction
\end{verbatim}

where:

\begin{itemize}
  \item \texttt{Q} if present, indicates that if any of the results overflow, they are saturated.
  \item \texttt{op} must be either \texttt{ADD} or \texttt{SUB}.
  \item \texttt{cond} is an optional condition code.
  \item \texttt{datatype} must be one of:
    \begin{itemize}
      \item I8, I16, I32, I64, F32 for \texttt{VADD} or \texttt{VSUB}
      \item S8, S16, S32 for \texttt{VQADD}, \texttt{VQSUB}, \texttt{VADDL}, \texttt{VADDW}, \texttt{VSUBL}, or \texttt{VSUBW}
      \item U8, U16, U32 for \texttt{VQADD}, \texttt{VQSUB}, \texttt{VADDL}, \texttt{VADDW}, \texttt{VSUBL}, or \texttt{VSUBW}
      \item S64, U64 for \texttt{VQADD} or \texttt{VQSUB}.
    \end{itemize}
  \item \texttt{Qd}, \texttt{Qn}, \texttt{Qm} are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
  \item \texttt{Dd}, \texttt{Dn}, \texttt{Dm} are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.
  \item \texttt{Qd}, \texttt{Dn}, \texttt{Dm} are the destination vector, the first operand vector, and the second operand vector, for a long operation.
  \item \texttt{Qd}, \texttt{Qn}, \texttt{Dm} are the destination vector, the first operand vector, and the second operand vector, for a wide operation.
\end{itemize}

\textbf{See also}

\textbf{Reference}

- \textit{Condition codes} on page 3-162.
4.6.4  V{R}ADDHN and V{R}SUBHN

V{R}ADDH (Vector Add and Narrow, selecting High half) adds corresponding elements in two vectors, selects the most significant halves of the results, and places the final results in the destination vector. Results can be either rounded or truncated.

V{R}SUBH (Vector Subtract and Narrow, selecting High half) subtracts the elements of one vector from the corresponding elements of another vector, selects the most significant halves of the results, and places the final results in the destination vector. Results can be either rounded or truncated.

Syntax

V{R}opHN{cond}.datatype Dd, Qn, Qm

where:

R if present, indicates that each result is rounded. Otherwise, each result is truncated.

op must be either ADD or SUB.

cond is an optional condition code.

datatype must be one of I16, I32, or I64.

Dd, Qn, Qm are the destination vector, the first operand vector, and the second operand vector.

See also

Reference

•  Condition codes on page 3-162.
4.6.5 **V{R}HADD and VHSUB**

**VHADD** (Vector Halving Add) adds corresponding elements in two vectors, shifts each result right one bit, and places the results in the destination vector. Results can be either rounded or truncated.

**VHSUB** (Vector Halving Subtract) subtracts the elements of one vector from the corresponding elements of another vector, shifts each result right one bit, and places the results in the destination vector. Results are always truncated.

**Syntax**

\[ \text{V{R}HADD}\{\text{cond}\}.\text{datatype}\{Qd\}, Qn, Qm} \]
\[ \text{V{R}HADD}\{\text{cond}\}.\text{datatype}\{Dd\}, Dn, Dm} \]
\[ \text{VHSUB}\{\text{cond}\}.\text{datatype}\{Qd\}, Qn, Qm} \]
\[ \text{VHSUB}\{\text{cond}\}.\text{datatype}\{Dd\}, Dn, Dm} \]

where:

- \( R \) if present, indicates that each result is rounded. Otherwise, each result is truncated.
- \( \text{cond} \) is an optional condition code.
- \( \text{datatype} \) must be one of S8, S16, S32, U8, U16, or U32.
- \( Qd, Qn, Qm \) are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- \( Dd, Dn, Dm \) are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.6.6 VPADD(L), VPADAL

VPADD (Vector Pairwise Add) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

![Figure 4-6 Example of operation of VPADD (in this case, for data type I16)](image)

VPADDL (Vector Pairwise Add Long) adds adjacent pairs of elements of a vector, sign or zero extends the results to twice their original width, and places the final results in the destination vector.

![Figure 4-7 Example of operation of doubleword VPADDL (in this case, for data type S16)](image)

VPADAL (Vector Pairwise Add and Accumulate Long) adds adjacent pairs of elements of a vector, and accumulates the absolute values of the results into the elements of the destination vector.

![Figure 4-8 Example of operation of VPADAL (in this case for data type S16)](image)

**Syntax**

VPADD\{cond\}.datatype \{Dd\}, \(Dn, Dm\)

VPADDL\{cond\}.datatype \(Qd, Qm\)

VPADAL\{cond\}.datatype \(Dd, Dm\)

where:

- \(op\) must be either ADD or ADA.
- \(cond\) is an optional condition code.
The `datatype` must be one of:

- I8, I16, I32, F32 for `VPADD`
- S8, S16, S32 for `VPADDL` or `VPADAL`
- U8, U16, U32 for `VPADDL` or `VPADAL`.

`Dd`, `Dn`, `Dm` are the destination vector, the first operand vector, and the second operand vector, for a `VPADD` instruction.

`Qd`, `Qm` are the destination vector and the operand vector, for a quadword `VPADDL` or `VPADAL`.

`Dd`, `Dm` are the destination vector and the operand vector, for a doubleword `VPADDL` or `VPADAL`.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.6.7 VMAX, VMIN, VPAX, and VPMIN

\texttt{VMAX} (Vector Maximum) compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

\texttt{VMIN} (Vector Minimum) compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

\texttt{VPAX} (Vector Pairwise Maximum) compares adjacent pairs of elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector. Operands and results must be doubleword vectors.

\texttt{VPMIN} (Vector Pairwise Minimum) compares adjacent pairs of elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector. Operands and results must be doubleword vectors.

\textbf{Syntax}

\begin{verbatim}
Vop{cond}.datatype Qd, Qn, Qm
Vop{cond}.datatype Dd, Dn, Dm
VPop{cond}.datatype Dd, Dn, Dm
\end{verbatim}

where:

- \texttt{op} must be either \texttt{MAX} or \texttt{MIN}.
- \texttt{cond} is an optional condition code.
- \texttt{datatype} must be one of \texttt{S8}, \texttt{S16}, \texttt{S32}, \texttt{U8}, \texttt{U16}, \texttt{U32}, or \texttt{F32}.
- \texttt{Qd}, \texttt{Qn}, \texttt{Qm} are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- \texttt{Dd}, \texttt{Dn}, \texttt{Dm} are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.

\textbf{Floating-point maximum and minimum}

\begin{align*}
\text{max}(+0.0, -0.0) &= +0.0. \\
\text{min}(+0.0, -0.0) &= -0.0
\end{align*}

If any input is a NaN, the corresponding result element is the default NaN.

\textbf{See also}

\textbf{Reference}

- \textit{Condition codes} on page 3-162
- \textit{VPADD{L}, VPADAL} on page 4-46.
4.6.8 VCLS, VCLZ, and VCNT

VCLS (Vector Count Leading Sign bits) counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector.

VCLZ (Vector Count Leading Zeros) counts the number of consecutive zeros, starting from the top bit, in each element in a vector, and places the results in a second vector.

VCNT (Vector Count set bits) counts the number of bits that are one in each element in a vector, and places the results in a second vector.

Syntax

\[ \text{Vop}\{\text{cond}\}.\text{datatype} \quad \text{Qd, Qm} \]

\[ \text{Vop}\{\text{cond}\}.\text{datatype} \quad \text{Dd, Dm} \]

where:

- \( \text{op} \) must be one of CLS, CLZ, or CNT.
- \( \text{cond} \) is an optional condition code.
- \( \text{datatype} \) must be one of:
  - S8, S16, or S32 for CLS.
  - I8, I16, or I32 for CLZ.
  - I8 for CNT.

\( \text{Qd, Qm} \) are the destination vector and the operand vector, for a quadword operation.

\( \text{Dd, Dm} \) are the destination vector and the operand vector, for a doubleword operation.

Reference

- Condition codes on page 3-162.
4.6.9 VRECPE and VRSQRTE

VRECPE (Vector Reciprocal Estimate) finds an approximate reciprocal of each element in a vector, and places the results in a second vector.

VRSQRTE (Vector Reciprocal Square Root Estimate) finds an approximate reciprocal square root of each element in a vector, and places the results in a second vector.

Syntax

\[ V\text{op}\{\text{cond}\}.\text{datatype}\ Qd,\ Qm \]

\[ V\text{op}\{\text{cond}\}.\text{datatype}\ Dd,\ Dm \]

where:

- \text{op} must be either RECPE or RSQRTE.
- \text{cond} is an optional condition code.
- \text{datatype} must be either U32 or F32.
- \text{Qd}, \text{Qm} are the destination vector and the operand vector, for a quadword operation.
- \text{Dd}, \text{Dm} are the destination vector and the operand vector, for a doubleword operation.

4.6.10 VRECPS and VRSQRTS

VRECPS (Vector Reciprocal Step) multiplies the elements of one vector by the corresponding elements of another vector, subtracts each of the results from 2, and places the final results into the elements of the destination vector.

VRSQRTS (Vector Reciprocal Square Root Step) multiplies the elements of one vector by the corresponding elements of another vector, subtracts each of the results from 3, divides these results by two, and places the final results into the elements of the destination vector.

**Syntax**

\[
\text{Vop}\{\text{cond}\}.\text{F32} \{\text{Qd}, \text{Qn}, \text{Qm}\} \\
\text{Vop}\{\text{cond}\}.\text{F32} \{\text{Dd}, \text{Dn}, \text{Dm}\}
\]

where:

- \text{op} must be either \text{RECPS} or \text{RSQRTS}.
- \text{cond} is an optional condition code.
- \text{Qd}, \text{Qn}, \text{Qm} are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- \text{Dd}, \text{Dn}, \text{Dm} are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.

**Results for out-of-range inputs**

Table 4-11 shows the results where input values are out of range.

<table>
<thead>
<tr>
<th>1st operand element</th>
<th>2nd operand element</th>
<th>Result element (VRECPS)</th>
<th>Result element (VRSQRTS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NaN</td>
<td>-</td>
<td>Default NaN</td>
<td>Default NaN</td>
</tr>
<tr>
<td>-</td>
<td>NaN</td>
<td>Default NaN</td>
<td>Default NaN</td>
</tr>
<tr>
<td>+/- 0.0 or denormal</td>
<td>+/- infinity</td>
<td>2.0</td>
<td>1.5</td>
</tr>
<tr>
<td>+/- infinity</td>
<td>+/- 0.0 or denormal</td>
<td>2.0</td>
<td>1.5</td>
</tr>
</tbody>
</table>

**Usage**

The Newton-Raphson iteration:

\[ x_{n+1} = x_n(2-dx_n) \]

converges to \((1/d)\) if \(x_0\) is the result of VRECPE applied to \(d\).

The Newton-Raphson iteration:

\[ x_{n+1} = x_n(3-dx_n^2)/2 \]

converges to \((1/\sqrt{d})\) if \(x_0\) is the result of VRSQRTE applied to \(d\).

  Vector Saturating Doubling Multiply returning High half (by vector or scalar).
4.7.1 VMUL{L}, VMLA{L}, and VMLS{L}

**VMUL** (Vector Multiply) multiplies corresponding elements in two vectors, and places the results in the destination vector.

**VMLA** (Vector Multiply Accumulate) multiplies corresponding elements in two vectors, and accumulates the results into the elements of the destination vector.

**VMLS** (Vector Multiply Subtract) multiplies corresponding elements in two vectors, subtracts the results from corresponding elements of the destination vector, and places the final results in the destination vector.

**Syntax**

\[ \text{Vop\{cond\}.datatype \{Qd\}, Qn, Qm} \]
\[ \text{Vop\{cond\}.datatype \{Dd\}, Dn, Dm} \]
\[ \text{VopL\{cond\}.datatype Qd, Dn, Dm} \]

where:

- **op** must be one of:
  - MUL Multiply
  - MLA Multiply Accumulate
  - MLS Multiply Subtract.
- **cond** is an optional condition code.
- **datatype** must be one of:
  - I8, I16, I32, F32 for VMUL, VMLA, or VMLS
  - S8, S16, S32 for VMULL, VMLAL, or VMLSL
  - U8, U16, U32 for VMULL, VMLAL, or VMLSL
  - P8 for VMUL or VMULL.

- **Qd**, **Qn**, **Qm** are the destination vector, the first operand vector, and the second operand vector, for a quadword operation.
- **Dd**, **Dn**, **Dm** are the destination vector, the first operand vector, and the second operand vector, for a doubleword operation.
- **Qd**, **Dn**, **Dm** are the destination vector, the first operand vector, and the second operand vector, for a long operation.

4.7.2 VMUL(L), VMLA(L), and VMLS(L) (by scalar)

VMUL (Vector Multiply by scalar) multiplies each element in a vector by a scalar, and places the results in the destination vector.

VMLA (Vector Multiply Accumulate) multiplies each element in a vector by a scalar, and accumulates the results into the corresponding elements of the destination vector.

VMLS (Vector Multiply Subtract) multiplies each element in a vector by a scalar, and subtracts the results from the corresponding elements of the destination vector, and places the final results in the destination vector.

Syntax

\[
\begin{align*}
&Vop\{cond\}.\text{datatype}\{Qd\},\ Qn,\ Dm[x] \\
&Vop\{cond\}.\text{datatype}\{Dd\},\ Dn,\ Dm[x] \\
&VopL\{cond\}.\text{datatype}\ Qd,\ Dn,\ Dm[x]
\end{align*}
\]

where:

- \(op\) must be one of:
  - \text{MUL} Multiply
  - \text{MLA} Multiply Accumulate
  - \text{MLS} Multiply Subtract.

- \(cond\) is an optional condition code.

- \(datatyp\)e must be one of:
  - \(I16,\ I32,\ F32\) for VMUL, VMLA, or VMLS
  - \(S16,\ S32\) for VMULL, VMLAL, or VMLSL
  - \(U16,\ U32\) for VMULL, VMLAL, or VMLSL.

- \(Qd,\ Qn\) are the destination vector and the first operand vector, for a quadword operation.

- \(Dd,\ Dn\) are the destination vector and the first operand vector, for a doubleword operation.

- \(Qd,\ Dn\) are the destination vector and the first operand vector, for a long operation.

- \(Dm[x]\) is the scalar holding the second operand.

See also

Reference

- Condition codes on page 3-162.
4.7.3 VFMA, VFMS

VFMA (Vector Fused Multiply Accumulate) multiplies corresponding elements in the two operand vectors, and accumulates the results into the elements of the destination vector. The result of the multiply is not rounded before the accumulation.

VFMS (Vector Fused Multiply Subtract) multiplies corresponding elements in the two operand vectors, then subtracts the products from the corresponding elements of the destination vector, and places the final results in the destination vector. The result of the multiply is not rounded before the subtraction.

Syntax

\[ Vop{\{cond\}}.F32 \{Qd\}, \ Qn, \ Qm \]
\[ Vop{\{cond\}}.F32 \{Dd\}, \ Dn, \ Dm \]
\[ Vop{\{cond\}}.F64 \{Dd\}, \ Dn, \ Dm \]
\[ Vop{\{cond\}}.F32 \{Sd\}, \ Sn, \ Sm \]

where:

- \( op \) is one of FMA or FMS.
- \( cond \) is an optional condition code.
- \( Sd, Sn, Sm \) are the destination and operand vectors for word operation.
- \( Dd, Dn, Dm \) are the destination and operand vectors for doubleword operation.
- \( Qd, Qn, Qm \) are the destination and operand vectors for quadword operation.

See also

Reference

- Condition codes on page 3-162
- VMUL{L}, VMLA{L}, and VMLS{L} on page 4-54.
4.7.4 VQD Mull, VQDMLAL, and VQDMLSL (by vector or by scalar)

Vector Saturating Doubling Multiply instructions multiply their operands and double the results. 
VQD Mull places the results in the destination register. VQDMLAL adds the results to the values in the 
destination register. VQDMLSL subtracts the results from the values in the destination register. 

If any of the results overflow, they are saturated. The sticky QC flag (FPSCR bit[27]) is set if 
saturation occurs.

Syntax

VQDopL{cond}.datatype Qd, Dn, Dm
VQDopL{cond}.datatype Qd, Dn, Dm[x]

where:

- **op** must be one of:
  - MUL Multiply
  - MLA Multiply Accumulate
  - MLS Multiply Subtract.

- **cond** is an optional condition code.

- **datatype** must be either S16 or S32.

- **Qd, Dn** are the destination vector and the first operand vector.

- **Dm** is the vector holding the second operand, for a *by vector* operation.

- **Dm[x]** is the scalar holding the second operand, for a *by scalar* operation.

See also

Reference

- Condition codes on page 3-162.
4.7.5  VQ{R}DMULH (by vector or by scalar)

Vector Saturating Doubling Multiply instructions multiply their operands and double the results. They return only the high half of the results.

If any of the results overflow, they are saturated. The sticky QC flag (FPSCR bit[27]) is set if saturation occurs.

Syntax

VQ{R}DMULH{cond}.datatype {Qd}, Qn, Qm
VQ{R}DMULH{cond}.datatype {Dd}, Dn, Dm
VQ{R}DMULH{cond}.datatype {Qd}, Qn, Dm[x]
VQ{R}DMULH{cond}.datatype {Dd}, Dn, Dm[x]

where:

R       if present, indicates that each result is rounded. Otherwise, each result is truncated.
cond    is an optional condition code.
datatype must be either S16 or S32.
Qd, Qn   are the destination vector and the first operand vector, for a quadword operation.
Dd, Dn   are the destination vector and the first operand vector, for a doubleword operation.
Qm or Dm is the vector holding the second operand, for a by vector operation.
Dm[x]   is the scalar holding the second operand, for a by scalar operation.

4.8 NEON load and store element and structure instructions

This section contains the following subsections:

- Interleaving.
- Alignment restrictions in load and store, element and structure instructions on page 4-60.
- VLDn and VSTn (single n-element structure to one lane) on page 4-61.
  This is used for almost all data accesses. A normal vector can be loaded ($n = 1$).
- VLDn (single n-element structure to all lanes) on page 4-63.
- VLDn and VSTn (multiple n-element structures) on page 4-65.

4.8.1 Interleaving

Many instructions in this group provide interleaving when structures are stored to memory, and de-interleaving when structures are loaded from memory. Figure 4-9 shows an example of de-interleaving. Interleaving is the inverse process.

![De-interleaving an array of 3-element structures](image-url)
4.8.2 Alignment restrictions in load and store, element and structure instructions

Many of these instructions permit memory alignment restrictions to be specified. When the alignment is not specified in the instruction, the alignment restriction is controlled by the A bit (SCTLR bit[1]):

- if the A bit is 0, there are no alignment restrictions (except for strongly ordered or device memory, where accesses must be element aligned or the result is UNPREDICTABLE)
- if the A bit is 1, accesses must be element aligned.

If an address is not correctly aligned, an alignment fault occurs.

See also

Reference

- ARM Architecture Reference Manual,
4.8.3  VLDn and VSTn (single n-element structure to one lane)

Vector Load single n-element structure to one lane. It loads one n-element structure from memory into one or more NEON registers. Elements of the register that are not loaded are unaltered.

Vector Store single n-element structure to one lane. It stores one n-element structure into memory from one or more NEON registers.

Syntax

\[ \text{Vopn}\{\text{cond}\}.\text{datatype list}, [\text{Rn}@\text{align}]\{!\} \]

\[ \text{Vopn}\{\text{cond}\}.\text{datatype list}, [\text{Rn}@\text{align}], \text{Rm} \]

where:

- **op** must be either LD or ST.
- **n** must be one of 1, 2, 3, or 4.
- **cond** is an optional condition code.
- **datatype** see Table 4-12.
- **list** specifies the NEON register list. See Table 4-12 for options.
- **Rn** is the ARM register containing the base address. **Rn** cannot be PC.
- **align** specifies an optional alignment. See Table 4-12 for options.
- **!** if ! is present, **Rn** is updated to \((\text{Rn} \pm \text{the number of bytes transferred by the instruction})\). The update occurs after all the loads or stores have taken place.
- **Rm** is an ARM register containing an offset from the base address. If **Rm** is present, **Rn** is updated to \((\text{Rn} + \text{Rm})\) after the address is used to access memory. **Rm** cannot be SP or PC.

4.8.4 **VLDn (single n-element structure to all lanes)**

Vector Load single n-element structure to all lanes. It loads multiple copies of one n-element structure from memory into one or more NEON registers.

**Syntax**

\[
\text{VLDn(\text{cond}).datatype list, [Rn[@align]]!}} \]

\[
\text{VLDn(\text{cond}).datatype list, [Rn[@align]], Rm}
\]

where:

- \( n \) must be one of 1, 2, 3, or 4.
- \( \text{cond} \) is an optional condition code.
- \( \text{datatype} \) see Table 4-13.
- \( \text{list} \) specifies the NEON register list. See Table 4-13 for options.
- \( Rn \) is the ARM register containing the base address. \( Rn \) cannot be PC.
- \( \text{align} \) specifies an optional alignment. See Table 4-13 for options.
- \( ! \) if ! is present, \( Rn \) is updated to \((Rn + \text{the number of bytes transferred by the instruction})\). The update occurs after all the loads or stores have taken place.
- \( Rm \) is an ARM register containing an offset from the base address. If \( Rm \) is present, \( Rn \) is updated to \((Rn + Rm)\) after the address is used to access memory. \( Rm \) cannot be SP or PC.

\*a. Every register in the list must be in the range D0-D31.  
\*b. align can be omitted. In this case, standard alignment rules apply, see *Alignment restrictions in load and store, element and structure instructions* on page 4-60.*
4.8.5 VLDn and VSTn (multiple n-element structures)

Vector Load multiple n-element structures. It loads multiple n-element structures from memory into one or more NEON registers, with de-interleaving (unless \( n = 1 \)). Every element of each register is loaded.

Vector Store multiple n-element structures. It stores multiple n-element structures to memory from one or more NEON registers, with interleaving (unless \( n = 1 \)). Every element of each register is stored.

Syntax

\[
\begin{align*}
V\text{op}\{\text{cond}\}.\text{datatype}\ \text{list}, \ [R\text{n}@\text{align}]\{!\} \\
V\text{op}\{\text{cond}\}.\text{datatype}\ \text{list}, \ [R\text{n}@\text{align}], \ R\text{m}
\end{align*}
\]

where:

- \( op \) must be either LD or ST.
- \( n \) must be one of 1, 2, 3, or 4.
- \( cond \) is an optional condition code.
- \( datatype \) see Table 4-14 for options.
- \( list \) specifies the NEON register list. See Table 4-14 for options.
- \( Rn \) is the ARM register containing the base address. \( Rn \) cannot be PC.
- \( align \) specifies an optional alignment. See Table 4-14 for options.
- \( ! \) if ! is present, \( Rn \) is updated to \((Rn + \) the number of bytes transferred by the instruction). The update occurs after all the loads or stores have taken place.
- \( Rm \) is an ARM register containing an offset from the base address. If \( Rm \) is present, \( Rn \) is updated to \((Rn + Rm) after\) the address is used to access memory. \( Rm \) cannot be SP or PC.

</tbody>
</table>
a. Every register in the list must be in the range D0-D31.
b. `align` can be omitted. In this case, standard alignment rules apply, see *Alignment restrictions in load and store, element and structure instructions* on page 4-60.

- *Condition codes* on page 3-162.
4.9 NEON and VFP pseudo-instructions

This section contains the following subsections:

- *VLDR pseudo-instruction on page 4-68* (NEON and VFP)
- *VLDR and VSTR (post-increment and pre-decrement)* on page 4-69 (NEON and VFP)
- *VMOV2 on page 4-70* (NEON only)
- *VAND and VORN (immediate)* on page 4-71 (NEON only)
- *VACLE and VACLT on page 4-72* (NEON only)
- *VCLE and VCLT on page 4-73* (NEON only).
4.9.1 VLDR pseudo-instruction

The VLDR pseudo-instruction loads a constant value into every element of a 64-bit NEON vector, or into a VFP single-precision or double-precision register.

Note

This section describes the VLDR pseudo-instruction only.

Syntax

VLDR{cond}.datatype Dd,=constant
VLDR{cond}.datatype Sd,=constant

where:

datatype must be one of:
  In  NEON only
  Sn  NEON only
  Un  NEON only
  F32 NEON or VFP
  F64 VFP only

n must be one of 8, 16, 32, or 64.

cond is an optional condition code.

Dd or Sd is the extension register to be loaded.

constant is an immediate value of the appropriate type for datatype.

Usage

If an instruction (for example, VMOV) is available that can generate the constant directly into the register, the assembler uses it. Otherwise, it generates a doubleword literal pool entry containing the constant and loads the constant using a VLDR instruction.

See also

Reference

• VLDR and VSTR on page 4-7
• Condition codes on page 3-162.
4.9.2 VLDR and VSTR (post-increment and pre-decrement)

Pseudo-instructions that load or store extension registers with post-increment and pre-decrement.

Note
There are also VLDR and VSTR instructions without post-increment and pre-decrement.

Syntax

```
op{cond}{.size} Fd, [Rn], #offset ; post-increment

op{cond}{.size} Fd, [Rn, #-offset]! ; pre-decrement
```

where:

- `op` can be:
  - VLDR - load extension register from memory
  - VSTR - store contents of extension register to memory.
- `cond` is an optional condition code.
- `size` is an optional data size specifier. Must be 32 if `Fd` is an S register, or 64 if `Fd` is a D register.
- `Fd` is the extension register to be loaded or saved. For a NEON instruction, it must be a doubleword (Dd) register. For a VFP instruction, it can be either a double precision (Dd) or a single precision (Sd) register.
- `Rn` is the ARM register holding the base address for the transfer.
- `offset` is a numeric expression that must evaluate to a numeric value at assembly time. The value must be 4 if `Fd` is an S register, or 8 if `Fd` is a D register.

Usage

The post-increment instruction increments the base address in the register by the offset value, after the transfer. The pre-decrement instruction decrements the base address in the register by the offset value, and then performs the transfer using the new address in the register. These pseudo-instructions assemble to VLDM or VSTM instructions.

See also

Reference

- **VLDR and VSTR** on page 4-7
- **VLDM, VSTM, VPOP, and VPUSH** on page 4-8
- **Condition codes** on page 3-162.
4.9.3 VMOV2

The VMOV2 pseudo-instruction generates an immediate value and places it in every element of a NEON vector, without loading a value from a literal pool. It always assembles to exactly two instructions.

VMOV2 can generate any 16-bit immediate value, and a restricted range of 32-bit and 64-bit immediate values.

Syntax

VMOV2{cond}.datatype Qd, #constant
VMOV2{cond}.datatype Dd, #constant

where:

datatype must be one of:
  • I8, I16, I32, or I64
  • S8, S16, S32, or S64
  • U8, U16, U32, or U64
  • F32.

cond is an optional condition code.

Qd or Dd is the extension register to be loaded.

constant is an immediate value of the appropriate type for datatype.

Usage

VMOV2 typically assembles to a VMOV or VMVN instruction, followed by a VBIC or VORR instruction.

See also

Reference

• VMOV, VMVN (immediate) on page 4-26
• VBIC and VORR (immediate) on page 4-15
• Condition codes on page 3-162.
4.9.4 **VAND and VORN (immediate)**

**VAND** (Bitwise AND immediate) takes each element of the destination vector, performs a bitwise AND with an immediate value, and returns the result into the destination vector.

**VORN** (Bitwise OR NOT immediate) takes each element of the destination vector, performs a bitwise OR Complement with an immediate value, and returns the result into the destination vector.

--- **Note** ---

On disassembly, these pseudo-instructions are disassembled to the corresponding `VBIC` and `VORR` instructions, with the complementary immediate values.

---

**Syntax**

\[ V\text{op}\{\text{cond}\} . \text{datatype} Qd, \#imm \]

\[ V\text{op}\{\text{cond}\} . \text{datatype} Dd, \#imm \]

where:

- \( op \) must be either VAND or VORN.
- \( cond \) is an optional condition code.
- \( datatype \) must be either I8, I16, I32, or I64.
- \( Qd \) or \( Dd \) is the NEON register for the result.
- \( imm \) is the immediate value.

**Immediate values**

If \( datatype \) is I16, the immediate value must have one of the following forms:

- 0xFFFXY
- 0xXYFF.

If \( datatype \) is I32, the immediate value must have one of the following forms:

- 0xFFFFFFFFXY
- 0xFFFFFFFFYFF
- 0xFFFFFFFFFF
- 0xYYYYFFFF.

**See also**

**Reference**

- *VBIC and VORR (immediate) on page 4-15*
- *Condition codes on page 3-162.*
4.9.5 VACLE and VACLT

Vector Absolute Compare takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the condition is true, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

Note

On disassembly, these pseudo-instructions are disassembled to the corresponding VACGE and VACGT instructions, with the operands reversed.

Syntax

VAC\{cond\}.datatype \{Qd\}, Qn, Qm
VAC\{cond\}.datatype \{Dd\}, Dn, Dm

where:

- \(op\) must be one of:
  - LE  Absolute Less than or Equal
  - LT  Absolute Less Than.
- \(cond\) is an optional condition code.
- \(datatype\) must be F32.
- \(Qd\) or \(Dd\) is the NEON register for the result.
  - The result datatype is I32.
- \(Qn\) or \(Dn\) is the NEON register holding the first operand.
- \(Qm\) or \(Dm\) is the NEON register holding the second operand.

See also

Reference

- *Condition codes* on page 3-162
- *VACGE and VACGT* on page 4-18.
4.9.6 VCLE and VCLT

Vector Compare takes the value of each element in a vector, and compares it with the value of the corresponding element of a second vector, or zero. If the condition is true, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

Note

On disassembly, these pseudo-instructions are disassembled to the corresponding VCGE and VCGT instructions, with the operands reversed.

Syntax

VC\{cond\}.datatype \{Qd\}, Qn, Qm
VC\{cond\}.datatype \{Dd\}, Dn, Dm

where:

\( op \) must be one of:
- LE Less than or Equal
- LT Less Than.

\( cond \) is an optional condition code.

\( datatype \) must be one of S8, S16, S32, U8, U16, U32, or F32.

\( Qd \) or \( Dd \) is the NEON register for the result.

The result datatype is:
- I32 for operand datatypes I32, S32, U32, or F32
- I16 for operand datatypes I16, S16, or U16
- I8 for operand datatypes I8, S8, or U8.

\( Qn \) or \( Dn \) is the NEON register holding the first operand.

\( Qm \) or \( Dm \) is the NEON register holding the second operand.

See also

Reference

- Condition codes on page 3-162
- VCLE and VCLT.
4.10 VFP instructions

This section contains the following subsections:

- \textit{VABS, VNEG, and VSQRT} on page 4-75
  Floating-point absolute value, negate, and square root.

- \textit{VADD, VSUB, and VDIV} on page 4-76
  Floating-point add, subtract, and divide.

- \textit{VMUL, VMLA, VMLS, VNMLU, VNMLA, and VNMLS} on page 4-77
  Floating-point multiply and multiply accumulate, with optional negation.

- \textit{VFMA, VFMS, VFNMA, VFNMS} on page 4-78
  Fused floating-point multiply accumulate and fused floating-point multiply subtract, with optional negation.

- \textit{VCMP} on page 4-79
  Floating-point compare.

- \textit{VCVT (between single-precision and double-precision)} on page 4-80
  Convert between single-precision and double-precision.

- \textit{VCVT (between floating-point and integer)} on page 4-81
  Convert between floating-point and integer.

- \textit{VCVT (between floating-point and fixed-point)} on page 4-82
  Convert between floating-point and fixed-point.

- \textit{VCVTB, VCVTT (half-precision extension)} on page 4-83
  Convert between half-precision and single-precision floating-point.

- \textit{VMOV} on page 4-84
  Insert a floating-point immediate value in a single-precision or double-precision register.
4.10.1 VABS, VNEG, and VSQRT

Floating-point absolute value, negate, and square root.

These instructions can be scalar, vector, or mixed.

Syntax

\[
V\text{op}\{\text{cond}\}.F32 \ Sd, \ Sm \\
V\text{op}\{\text{cond}\}.F64 \ Dd, \ Dm
\]

where:

- \text{op} is one of \text{ABS}, \text{NEG}, or \text{SQRT}.
- \text{cond} is an optional condition code.
- \text{Sd}, \text{Sm} are the single-precision registers for the result and operand.
- \text{Dd}, \text{Dm} are the double-precision registers for the result and operand.

Usage

The \text{VABS} instruction takes the contents of \text{Sm} or \text{Dm}, clears the sign bit, and places the result in \text{Sd} or \text{Dd}. This gives the absolute value.

The \text{VNEG} instruction takes the contents of \text{Sm} or \text{Dm}, changes the sign bit, and places the result in \text{Sd} or \text{Dd}. This gives the negation of the value.

The \text{VSQRT} instruction takes the square root of the contents of \text{Sm} or \text{Dm}, and places the result in \text{Sd} or \text{Dd}.

In the case of a \text{VABS} and \text{VNEG} instruction, if the operand is a NaN, the sign bit is determined in each case as above, but no exception is produced.

Floating-point exceptions

\text{VABS} and \text{VNEG} instructions cannot produce any exceptions.

\text{VSQRT} instructions can produce Invalid Operation or Inexact exceptions.

See also

Concepts

Using the Assembler:

- Control of scalar, vector, and mixed operations on page 9-38.

Reference

- Condition codes on page 3-162.
4.10.2   VADD, VSUB, and VDIV

Floating-point add, subtract, and divide.

These instructions can be scalar, vector, or mixed.

Syntax

\[ \text{Vop}\{\text{cond}\}.F32 \{\text{Sd}, \text{Sn}, \text{Sm}\} \]
\[ \text{Vop}\{\text{cond}\}.F64 \{\text{Dd}, \text{Dn}, \text{Dm}\} \]

where:

- \( \text{op} \) is one of ADD, SUB, or DIV.
- \( \text{cond} \) is an optional condition code.
- \( \text{Sd}, \text{Sn}, \text{Sm} \) are the single-precision registers for the result and operands.
- \( \text{Dd}, \text{Dn}, \text{Dm} \) are the double-precision registers for the result and operands.

Usage

The VADD instruction adds the values in the operand registers and places the result in the destination register.

The VSUB instruction subtracts the value in the second operand register from the value in the first operand register, and places the result in the destination register.

The VDIV instruction divides the value in the first operand register by the value in the second operand register, and places the result in the destination register.

Floating-point exceptions

VADD and VSUB instructions can produce Invalid Operation, Overflow, or Inexact exceptions.

VDIV operations can produce Division by Zero, Invalid Operation, Overflow, Underflow, or Inexact exceptions.

See also

Concepts

Using the Assembler:

- Control of scalar, vector, and mixed operations on page 9-38.

Reference

- Condition codes on page 3-162.
4.10.3 VMUL, VMLA, VMLS, VN MUL, VNMLA, and VNMLS

Floating-point multiply and multiply accumulate, with optional negation.

These instructions can be scalar, vector, or mixed.

Syntax

V{N}MUL{cond}.F32 {Sd,} Sn, Sm
V{N}MUL{cond}.F64 {Dd,} Dn, Dm
V{N}MLA{cond}.F32 Sd, Sn, Sm
V{N}MLA{cond}.F64 Dd, Dn, Dm
V{N}MLS{cond}.F32 Sd, Sn, Sm
V{N}MLS{cond}.F64 Dd, Dn, Dm

where:

N    negates the final result.
cond is an optional condition code.
Sd, Sn, Sm   are the single-precision registers for the result and operands.
Dd, Dn, Dm   are the double-precision registers for the result and operands.

Usage

The VMUL operation multiplies the values in the operand registers and places the result in the destination register.

The VMLA operation multiplies the values in the operand registers, adds the value in the destination register, and places the final result in the destination register.

The VMLS operation multiplies the values in the operand registers, subtracts the result from the value in the destination register, and places the final result in the destination register.

In each case, the final result is negated if the N option is used.

Floating-point exceptions

These instructions can produce Invalid Operation, Overflow, Underflow, Inexact, or Input Denormal exceptions.

See also

Concepts

Using the Assembler:
- Control of scalar, vector, and mixed operations on page 9-38.

Reference

- Condition codes on page 3-162.
4.10.4 VFMA, VFMS, VFNMA, VFNMS

Fused floating-point multiply accumulate and fused floating-point multiply subtract with optional negation.

These instructions are always scalar.

Syntax

\[
\text{VF\{N\}} \text{op\{ cond\}.F64 \{Dd\}, Dn, Dm} \\
\text{VF\{N\}} \text{op\{ cond\}.F32 \{Sd\}, Sn, Sm}
\]

where:

- \(\text{op}\) is one of MA or MS.
- \(N\) negates the final result.
- \(\text{cond}\) is an optional condition code.
- \(Sd, Sn, Sm\) are the single-precision registers for the result and operands.
- \(Dd, Dn, Dm\) are the double-precision registers for the result and operands.
- \(Qd, Qn, Qm\) are the double-precision registers for the result and operands.

Usage

VFMA multiplies the values in the operand registers, adds the value in the destination register, and places the final result in the destination register. The result of the multiply is not rounded before the accumulation.

VFMS multiplies the values in the operand registers, subtracts the product from the value in the destination register, and places the final result in the destination register. The result of the multiply is not rounded before the subtraction.

In each case, the final result is negated if the \(N\) option is used.

Floating-point exceptions

These instructions can produce Input Denormal, Invalid Operation, Overflow, Underflow, or Inexact exceptions.

See also

Concepts

Using the Assembler:

- Control of scalar, vector, and mixed operations on page 9-38.

Reference

- Condition codes on page 3-162
- \(\text{VMUL, VMLA, VMLS, VNMUL, VNMLA, and VNMLS}\) on page 4-77.
4.10.5 VCMP

Floating-point compare.

VCMP is always scalar.

Syntax

VCMP{cond}.F32  Sd, Sm
VCMP{cond}.F32  Sd, #0
VCMP{cond}.F64  Dd, Dm
VCMP{cond}.F64  Dd, #0

where:

cond is an optional condition code.
Sd, Sm are the single-precision registers holding the operands.
Dd, Dm are the double-precision registers holding the operands.

Usage

The VCMP instruction subtracts the value in the second operand register (or 0 if the second operand is #0) from the value in the first operand register, and sets the VFP condition flags on the result.

Floating-point exceptions

VCMP instructions can produce Invalid Operation exceptions.

See also

Reference

• Condition codes on page 3-162.
### 4.10.6 VCVT (between single-precision and double-precision)

Convert between single-precision and double-precision numbers. VCVT is always scalar.

**Syntax**

`VCVT{cond}.F64.F32  Dd,  Sm`

`VCVT{cond}.F32.F64  Sd,  Dm`

where:

- `cond` is an optional condition code.
- `Dd` is a double-precision register for the result.
- `Sm` is a single-precision register holding the operand.
- `Sd` is a single-precision register for the result.
- `Dm` is a double-precision register holding the operand.

**Usage**

These instructions convert the single-precision value in `Sm` to double-precision and places the result in `Dd`, or the double-precision value in `Dm` to single-precision and place the result in `Sd`.

**Floating-point exceptions**

These instructions can produce Invalid Operation, Input Denormal, Overflow, Underflow, or Inexact exceptions.

**See also**

**Reference**

- *Condition codes on page 3-162.*
4.10.7 VCVT (between floating-point and integer)

Convert between floating-point numbers and integers. VCVT is always scalar.

Syntax

VCVT{R}{{cond}.type.F64  Sd, Dm
VCVT{R}{{cond}.type.F32  Sd, Sm
VCVT{{cond}.F64.type  Dd, Sm
VCVT{{cond}.F32.type  Sd, Sm

where:

R makes the operation use the rounding mode specified by the FPSCR. Otherwise, the operation rounds towards zero.

cond is an optional condition code.

type can be either U32 (unsigned 32-bit integer) or S32 (signed 32-bit integer).

Sd is a single-precision register for the result.

Dd is a double-precision register for the result.

Sm is a single-precision register holding the operand.

Dm is a double-precision register holding the operand.

Usage

The first two forms of this instruction convert from floating-point to integer.
The third and fourth forms convert from integer to floating-point.

Floating-point exceptions

These instructions can produce Input Denormal, Invalid Operation, or Inexact exceptions.

See also

Reference

• Condition codes on page 3-162.
4.10.8 VCVT (between floating-point and fixed-point)

Convert between floating-point and fixed-point numbers.

VCVT is always scalar.

Syntax

VCVT{cond}.type.F64 Dd, Dd, #fbits
VCVT{cond}.type.F32 Sd, Sd, #fbits
VCVT{cond}.F64.type Dd, Dd, #fbits
VCVT{cond}.F32.type Sd, Sd, #fbits

where:

cond is an optional condition code.

type can be any one of:

S16 16-bit signed fixed-point number
U16 16-bit unsigned fixed-point number
S32 32-bit signed fixed-point number
U32 32-bit unsigned fixed-point number.

Sd is a single-precision register for the operand and result.

Dd is a double-precision register for the operand and result.

fbits is the number of fraction bits in the fixed-point number, in the range 0-16 if type is S16 or U16, or in the range 1-32 if type is S32 or U32.

Usage

The first two forms of this instruction convert from floating-point to fixed-point.

The third and fourth forms convert from fixed-point to floating-point.

In all cases the fixed-point number is contained in the least significant 16 or 32 bits of the register.

Floating-point exceptions

These instructions can produce Input Denormal, Invalid Operation, or Inexact exceptions.

See also

Reference

• Condition codes on page 3-162.
4.10.9 VCVTB, VCVTT (half-precision extension)

Converts between half-precision and single-precision floating-point numbers in the following ways:

- **VCVTB** uses the bottom half (bits[15:0]) of the single word register to obtain or store the half-precision value
- **VCVTT** uses the top half (bits[31:16]) of the single word register to obtain or store the half-precision value.

VCVTB and VCVTT are always scalar.

**Syntax**

\[
\text{VCVTB}\{\text{cond}\} \cdot \text{type} \quad \text{Sd, Sm} \\
\text{VCVTT}\{\text{cond}\} \cdot \text{type} \quad \text{Sd, Sm}
\]

where:

- \(\text{cond}\) is an optional condition code.
- \(\text{type}\) can be any one of:
  - \(\text{F32.F16}\) convert from half-precision to single-precision
  - \(\text{F16.F32}\) convert from single-precision to half-precision.
- \(\text{Sd}\) is a single word register for the result.
- \(\text{Sm}\) is a single word register for the operand.

**Architectures**

The instructions are only available in VFPv3 systems with the half-precision extension.

**Floating-point exceptions**

These instructions can produce Input Denormal, Invalid Operation, Overflow, Underflow, or Inexact exceptions.

**See also**

**Reference**

- Condition codes on page 3-162.
4.10.10 VMOV

Insert a floating-point immediate value in a single-precision or double-precision register, or copy one register into another register.

This instruction is always scalar.

**Syntax**

\[
\text{VMOV}\{\text{cond}\}.F32 \ Sd, \ #imm \\
\text{VMOV}\{\text{cond}\}.F64 \ Dd, \ #imm \\
\text{VMOV}\{\text{cond}\}.F32 \ Sd, \ Sm \\
\text{VMOV}\{\text{cond}\}.F64 \ Dd, \ Dm
\]

where:

- \( \text{cond} \) is an optional condition code.
- \( Sd \) is the single-precision destination register.
- \( Dd \) is the double-precision destination register.
- \( \text{imm} \) is the floating-point immediate value.
- \( Sm \) is the single-precision source register.
- \( Dm \) is the double-precision source register.

**Immediate values**

Any number that can be expressed as \( \pm n \times 2^{-r} \), where \( n \) and \( r \) are integers, \( 16 \leq n \leq 31 \), \( 0 \leq r \leq 7 \).

**Architectures**

The instructions that copy immediate constants are available in VFPv3.

The instructions that copy from register are available on all VFP systems.

Chapter 5
Wireless MMX Technology Instructions

The following topics describe support for Wireless MMX Technology instructions:

- Introduction on page 5-2
- ARM support for Wireless MMX technology on page 5-3
- Wireless MMX instructions on page 5-6
- Wireless MMX pseudo-instructions on page 5-8.
5.1 Introduction

Marvell Wireless MMX Technology is a set of Single Instruction Multiple Data (SIMD) instructions available on selected XScale processors that improve the performance of some multimedia applications. Wireless MMX Technology uses 64-bit registers to enable it to operate on multiple data elements in a packed format.

The assembler supports Marvell Wireless MMX Technology instructions to assemble code to run on the PXA270 processor. This processor implements ARMv5TE architecture, with MMX extensions. Wireless MMX Technology uses ARM coprocessors 0 and 1 to support its instruction set and data types. ARM Compiler toolchain supports Wireless MMX Technology Control and Single Instruction Multiple Data (SIMD) Data registers, and include new directives for Wireless MMX Technology development. There is also enhanced support for load and store instructions.

When using the assembler, be aware that:

- Wireless MMX Technology instructions are only assembled if you specify the supported processor (`armasm --device PXA270`).
- The PXA270 processor supports code written in ARM or Thumb only.
- Most Wireless MMX Technology instructions can be executed conditionally, depending on the state of the ARM flags. The Wireless MMX Technology condition codes are identical to the ARM condition codes.

Wireless MMX 2 Technology is an upgraded version of Wireless MMX Technology.

This contains information on the Wireless MMX Technology support provided by the assembler in the ARM Compiler toolchain. It does not provide a detailed description of the Wireless MMX Technology. Wireless MMX Technology Developer Guide contains information about the programmers’ model and a full description of the Wireless MMX Technology instruction set.

See also

Reference

- Wireless MMX Technology Developer Guide.
5.2 ARM support for Wireless MMX technology

This section gives information on the assembler support for Wireless MMX and MMX 2 Technology. It describes:

- Directives, WRN and WCN
- Frame directives
- Wireless MMX load and store instructions on page 5-4
- Wireless MMX Technology and XScale instructions on page 5-5.

5.2.1 Directives, WRN and WCN

Directives are available to support Wireless MMX Technology:

WCN  Defines a name for a specified Control register, for example:
      speed WCN wcgr0 ; defines speed as a symbol for control reg 0

WRN  Defines a name for a specified SIMD Data register, for example:
      rate WRN wr6 ; defines rate as a symbol for data reg 6

Avoid conflicting uses of the same register under different names. Do not use any of the predefined register and coprocessor names.

5.2.2 Frame directives

Wireless MMX Technology registers can be used with FRAME directives in the usual way to add debug information into your object files. Be aware of the following restrictions:

- A warning is given if you try to push Wireless MMX Technology registers wR0 - wR9 or wCGR0 - wCGR3 onto the stack.
- Wireless MMX Technology registers cannot be used as address offsets.
5.2.3 Wireless MMX load and store instructions

Load and store byte, halfword, word or doublewords to and from Wireless MMX coprocessor registers.

Syntax

\[ \text{op<type>{cond} wRd, [Rn, #(-)offset]!!} \]
\[ \text{op<type>{cond} wRd, [Rn] {, #(-)offset}} \]
\[ \text{opW{cond} wRd, label} \]
\[ \text{opW wCd, [Rn, #(-)offset]!!} \]
\[ \text{opW wCd, [Rn] {, #(-)offset}} \]
\[ \text{opD{cond} wRd, label} \]
\[ \text{opD wRd, [Rn, -]Rm {, LSL #imm4}!!} \] ; MMX2 only
\[ \text{opD wRd, [Rn], -]Rm {, LSL #imm4} } \] ; MMX2 only

where:

- \text{op} can be either:
  - WLDR  Load Wireless MMX Register
  - WSTR  Store Wireless MMX Register.

- \text{<type>} can be any one of:
  - B  Byte
  - H  Halfword
  - W  Word
  - D  Doubleword.

- \text{cond} is an optional condition code.

- \text{wRd} is the Wireless MMX SIMD data register to load or save.

- \text{wCd} is the Wireless MMX Status and Control register to load or save.

- \text{Rn} is the register on which the memory address is based.

- \text{offset} is an immediate offset. If offset is omitted, the instruction is a zero offset instruction.

- \text{!} is an optional suffix. If \text{!} is present, the instruction is a pre-indexed instruction.

- \text{label} is a PC-relative expression.

- \text{Rm} is a register containing a value to be used as the offset. \text{Rm} must not be PC.

- \text{imm4} contains the number of bits to shift \text{Rm} left, in the range 0-15.

Loading constants into SIMD registers

The assembler also supports the WLDRW and WLDRD literal load pseudo-instructions, for example:

\[ \text{WLDRW wr0, =0x114} \]
Be aware that:

- The assembler cannot load byte and halfword literals. These produce a downgradable error. If downgraded, the instruction is converted to a `WLDRW` and a 32-bit literal is generated. This is the same as a byte literal load, but uses a 32-bit word instead.
- If the literal to be loaded is zero, and the destination is a SIMD Data register, the assembler converts the instruction to a `WZERO`.
- Doubleword loads that are not 8-byte aligned are UNPREDICTABLE.

### 5.2.4 Wireless MMX Technology and XScale instructions

Wireless MMX Technology instructions overlap with XScale instructions. To avoid conflicts, the assembler has the following restrictions:

- You cannot mix the XScale instructions with Wireless MMX Technology instructions in the same assembly.
- Wireless MMX Technology TMIA instructions have a `MIA` mnemonic that overlaps with the XScale `MIA` instructions. Be aware that:
  - `MIA acc0, Rm, Rs` is accepted in XScale, but faulted in Wireless MMX Technology.
  - `MIA wR0, Rm, Rs` and `TMIA wR0, Rm, Rs` are accepted in Wireless MMX Technology.
  - `TMIA acc0, Rm, Rs` is faulted in XScale (XScale has no `TMIA` instruction).

Directives Reference

The following topics describe the directives that are provided by the ARM assembler, armasm:

- *Alphabetical list of directives* on page 6-2
- *Symbol definition directives* on page 6-3
- *Data definition directives* on page 6-15
- *Assembly control directives* on page 6-29
- *Frame directives* on page 6-37
- *Reporting directives* on page 6-50
- *Instruction set and syntax selection directives* on page 6-55
- *Miscellaneous directives* on page 6-57.

--- Note ---

None of these directives are available in the inline assemblers in the ARM C and C++ compilers.
## 6.1 Alphabetical list of directives

Table 6-1 shows a complete list of the directives. Use it to locate individual directives.

</table>
6.2 Symbol definition directives

This section describes the following directives:

- **GBLA, GBLL, and GBLS on page 6-4**
  Declare a global arithmetic, logical, or string variable.

- **LCLA, LCLL, and LCLS on page 6-6**
  Declare a local arithmetic, logical, or string variable.

- **SETA, SETL, and SETS on page 6-7**
  Set the value of an arithmetic, logical, or string variable.

- **RELOC on page 6-8**
  Encode an ELF relocation in an object file.

- **RN on page 6-9**
  Define a name for a specified register.

- **RLIST on page 6-10**
  Define a name for a set of general-purpose registers.

- **CN on page 6-11**
  Define a coprocessor register name.

- **CP on page 6-12**
  Define a coprocessor name.

- **QN, DN, and SN on page 6-13**
  Define a double-precision or single-precision VFP register name.
6.2.1 GBLA, GBLL, and GBLS

The GBLA directive declares a global arithmetic variable, and initializes its value to 0.
The GBLL directive declares a global logical variable, and initializes its value to {FALSE}.
The GBLS directive declares a global string variable and initializes its value to a null string, ".".

**Syntax**

```<gbla> variable```

where:
```
<gbla> is one of GBLA, GBLL, or GBLS.
variable is the name of the variable. variable must be unique among symbols within a source file.
```

**Usage**

Using one of these directives for a variable that is already defined re-initializes the variable to the same values given above.
The scope of the variable is limited to the source file that contains it.
Set the value of the variable with a SETA, SETL, or SETS directive.
Global variables can also be set with the --predefine assembler command line option.

**Examples**

**Example 6-1** declares a variable `objectsize`, sets the value of `objectsize` to 0xFF, and then uses it later in a SPACE directive.

```
Example 6-1

GBLA    objectsize  ; declare the variable name
objectsize  SETA    0xFF          ; set its value
.        ; other code
.        ;
SPACE   objectsize  ; quote the variable
```

**Example 6-2** shows how to declare and set a variable when you invoke armasm. Use this when you want to set the value of a variable at assembly time. --pd is a synonym for --predefine.

```
Example 6-2

armasm --predefine "objectsize SETA 0xFF" sourcefile -o objectfile
```
See also

Reference

- *SETA, SETL, and SETS* on page 6-7
- *LCLA, LCLL, and LCLS* on page 6-6
- *Assembler command line options* on page 2-3.
6.2.2 LCLA, LCLL, and LCLS

The LCLA directive declares a local arithmetic variable, and initializes its value to 0.
The LCLL directive declares a local logical variable, and initializes its value to \{FALSE\}.
The LCLS directive declares a local string variable, and initializes its value to a null string, "".

Syntax

\(<lclx>\) variable

where:

\(<lclx>\) is one of LCLA, LCLL, or LCLS.

variable is the name of the variable. variable must be unique within the macro that contains it.

Usage

Using one of these directives for a variable that is already defined re-initializes the variable to the same values given above.
The scope of the variable is limited to a particular instantiation of the macro that contains it.
Set the value of the variable with a SETA, SETL, or SETS directive.

Example

MACRO $label  message $a ; Declare a macro
  LCLS err ; Declare local string
  err SETS "error no: " ; Set value of err
$label ; code
  INFO 0, "err":CC::STR:$a ; Use string
MEND

See also

Reference

• SETA, SETL, and SETS on page 6-7
• MACRO and MEND on page 6-30
• GBLA, GBLL, and GBLS on page 6-4.
6.2.3 SETA, SETL, and SETS

The SETA directive sets the value of a local or global arithmetic variable.
The SETL directive sets the value of a local or global logical variable.
The SETS directive sets the value of a local or global string variable.

Syntax

\[ \text{variable} \ <\text{setx}> \ \text{expr} \]

where:

\(<\text{setx}>\) is one of SETA, SETL, or SETS.
\(\text{variable}\) is the name of a variable declared by a GBLA, GBLL, GBLS, LCLA, LCLL, or LCLS directive.
\(\text{expr}\) is an expression that is:

- numeric, for SETA
- logical, for SETL
- string, for SETS.

Usage

You must declare \(\text{variable}\) using a global or local declaration directive before using one of these directives.

You can also predefine variable names on the command line.

Examples

\begin{verbatim}
GBLA   VersionNumber
VersionNumber   SETA    21
GBLL   Debug
Debug           SETL    \{TRUE\}
GBLS   VersionString
VersionString   SETS    "Version 1.0"
\end{verbatim}

See also

Concepts

Using the Assembler:
- Numeric expressions on page 8-16
- Logical expressions on page 8-19
- String expressions on page 8-14.

Reference

- Assembler command line options on page 2-3
- LCLA, LCLL, and LCLS on page 6-6
- GBLA, GBLL, and GBLS on page 6-4.
6.2.4 **RELOC**

The **RELOC** directive explicitly encodes an ELF relocation in an object file.

**Syntax**

RELOC \( n \), \( symbol \)

RELOC \( n \)

where:

\( n \) must be an integer in the range 0 to 255 or one of the relocation names defined in the Application Binary Interface for the ARM Architecture.

\( symbol \) can be any PC-relative label.

**Usage**

Use RELOC \( n \), \( symbol \) to create a relocation with respect to the address labeled by \( symbol \).

If used immediately after an ARM or Thumb instruction, RELOC results in a relocation at that instruction. If used immediately after a DCB, DCW, or DCD, or any other data generating directive, RELOC results in a relocation at the start of the data. Any addend to be applied must be encoded in the instruction or in the data.

If the assembler has already emitted a relocation at that place, the relocation is updated with the details in the RELOC directive, for example:

```assembly
DCD   sym2 ; R_ARM_ABS32 to sym32
RELOC  55  ; ... makes it R_ARM_ABS32_NOI
```

RELOC is faulted in all other cases, for example, after any non-data generating directive, LTORG, ALIGN, or as the first thing in an AREA.

Use RELOC \( n \) to create a relocation with respect to the anonymous symbol, that is, symbol 0 of the symbol table. If you use RELOC \( n \) without a preceding assembler generated relocation, the relocation is with respect to the anonymous symbol.

**Examples**

```assembly
IMPORT  impsym
LDR     r0,[pc,#-8]
RELOC   4, impsym
DCD     0
RELOC   2, sym
DCD     0,1,2,3,4 ; the final word is relocated
RELOC   38,sym2   ; R_ARM_TARGET1
DCD     impsym
RELOC   R_ARM_TARGET1 ; relocation code 38
```

**See also**

**Reference**

6.2.5 RN

The RN directive defines a register name for a specified register.

Syntax

\[
\text{name RN expr}
\]

where:

\[
\text{name} \quad \text{is the name to be assigned to the register. name cannot be the same as any of the predefined names.}
\]

\[
\text{expr} \quad \text{evaluates to a register number from 0 to 15.}
\]

Usage

Use RN to allocate convenient names to registers, to help you to remember what you use each register for. Be careful to avoid conflicting uses of the same register under different names.

Examples

\[
\text{regname RN 11} \quad ; \text{defines regname for register 11}
\]

\[
\text{sqr4 RN r6} \quad ; \text{defines sqr4 for register 6}
\]

See also

Reference

Using the Assembler:

- Predeclared core register names on page 3-13
- Predeclared extension register names on page 3-14
- Predeclared XScale register names on page 3-15
- Predeclared coprocessor names on page 3-16.
6.2.6 RLIST

The RLIST (register list) directive gives a name to a set of general-purpose registers.

Syntax

\[ \text{name RLIST \{list-of-registers\}} \]

where:

- **name** is the name to be given to the set of registers. *name* cannot be the same as any of the predefined names.
- **list-of-registers** is a comma-delimited list of register names and register ranges. The register list must be enclosed in braces.

Usage

Use RLIST to give a name to a set of registers to be transferred by the LDM or STM instructions.

LDM and STM always put the lowest physical register numbers at the lowest address in memory, regardless of the order they are supplied to the LDM or STM instruction. If you have defined your own symbolic register names it can be less apparent that a register list is not in increasing register order.

Use the --diag_warning 1206 assembler option to ensure that the registers in a register list are supplied in increasing register order. If registers are not supplied in increasing register order, a warning is issued.

Example

Context RLIST \{r0-r6,r8,r10-r12,pc\}

See also

Reference

Using the Assembler:

- Predeclared core register names on page 3-13
- Predeclared extension register names on page 3-14
- Predeclared XScale register names on page 3-15
- Predeclared coprocessor names on page 3-16.
6.2.7  CN

The CN directive defines a name for a coprocessor register.

Syntax

(name) CN (expr)

where:

(name) is the name to be defined for the coprocessor register. name cannot be the same as any of the predefined names.

(expr) evaluates to a coprocessor register number from 0 to 15.

Usage

Use CN to allocate convenient names to registers, to help you remember what you use each register for.

Note

Avoid conflicting uses of the same register under different names.

The names c0 to c15 are predefined.

Example

power  CN  6        ; defines power as a symbol for coprocessor register 6

See also

Reference

Using the Assembler:

• Predeclared core register names on page 3-13
• Predeclared extension register names on page 3-14
• Predeclared XScale register names on page 3-15
• Predeclared coprocessor names on page 3-16.
6.2.8 CP

The CP directive defines a name for a specified coprocessor. The coprocessor number must be within the range 0 to 15.

**Syntax**

```plaintext
name CP expr
```

where:

- `name` is the name to be assigned to the coprocessor. `name` cannot be the same as any of the predefined names.
- `expr` evaluates to a coprocessor number from 0 to 15.

**Usage**

Use CP to allocate convenient names to coprocessors, to help you to remember what you use each one for.

--- **Note** ---

Avoid conflicting uses of the same coprocessor under different names.

---

The names p0 to p15 are predefined for coprocessors 0 to 15.

**Example**

```plaintext
dmu CP 6       ; defines dmu as a symbol for
               ; coprocessor 6
```

**See also**

- Predeclared extension register names on page 3-14
- Predeclared XScale register names on page 3-15
- Predeclared coprocessor names on page 3-16.
6.2.9 QN, DN, and SN

The QN directive defines a name for a specified 128-bit extension register.
The DN directive defines a name for a specified 64-bit extension register.
The SN directive defines a name for a specified single-precision VFP register.

Syntax

\[ \text{name directive expr.type\{[x]\}} \]

where:

- \text{directive} is QN, DN, or SN.
- \text{name} is the name to be assigned to the extension register. \text{name} cannot be the same as any of the predefined names.
- \text{expr} Can be:
  - an expression that evaluates to a number in the range:
    - 0-15 if you are using DN in VFPv2 or QN in NEON
    - 0-31 otherwise.
  - a predefined register name, or a register name that has already been defined in a previous directive.
- \text{type} is any NEON or VFP datatype.
- \[\{x\}\] is only available for NEON code. \[x\] is a scalar index into a register.
- \text{type} and \[\{x\}\] are Extended notation.

Usage

Use QN, DN, or SN to allocate convenient names to extension registers, to help you to remember what you use each one for.

--- Note ---

Avoid conflicting uses of the same register under different names.

You cannot specify a vector length in a DN or SN directive.

Examples

\begin{align*}
\text{energy DN 6 } & \quad \text{defines energy as a symbol for} \quad \text{VFP double-precision register 6} \\
\text{mass SN 16 } & \quad \text{defines mass as a symbol for} \quad \text{VFP single-precision register 16}
\end{align*}

Extended notation examples

\begin{align*}
\text{varA DN } & \quad \text{d1.U16} \\
\text{varB DN } & \quad \text{d2.U16} \\
\text{varC DN } & \quad \text{d3.U16} \quad \text{VADD varA, varB, varC } \quad \text{VADD.U16 d1, d2, d3} \\
\text{index DN } & \quad \text{d4.U16\{0\}} \\
\text{result QN } & \quad \text{q5.I32} \quad \text{VMULL result, varA, index } \quad \text{VMULL.U16 q5, d1, d3\{2\}}
\end{align*}

6.3 Data definition directives

This section describes the following directives to allocate memory, define data structures, set initial contents of memory:

- **LTORG** on page 6-16
  Set an origin for a literal pool.

- **MAP** on page 6-17
  Set the origin of a storage map.

- **FIELD** on page 6-18
  Define a field within a storage map.

- **SPACE or FILL** on page 6-19
  Allocate a zeroed block of memory.

- **DCB** on page 6-20
  Allocate bytes of memory, and specify the initial contents.

- **DCD and DCDU** on page 6-21
  Allocate words of memory, and specify the initial contents.

- **DCDO** on page 6-22
  Allocate words of memory, and specify the initial contents as offsets from the static base register.

- **DCFD and DCFDU** on page 6-23
  Allocate doublewords of memory, and specify the initial contents as double-precision floating-point numbers.

- **DCFS and DCFSU** on page 6-24
  Allocate words of memory, and specify the initial contents as single-precision floating-point numbers.

- **DCI** on page 6-25
  Allocate words of memory, and specify the initial contents. Mark the location as code not data.

- **DCQ and DCQU** on page 6-26
  Allocate doublewords of memory, and specify the initial contents as 64-bit integers.

- **DCW and DCWU** on page 6-27
  Allocate halfwords of memory, and specify the initial contents.

- **COMMON** on page 6-28
  Allocate a block of memory at a symbol, and specify the alignment.

- **DATA** on page 6-28
  Mark data within a code section. Obsolete, for backwards compatibility only.
6.3.1 LTORG

The LTORG directive instructs the assembler to assemble the current literal pool immediately.

Syntax

LTORG

Usage

The assembler assembles the current literal pool at the end of every code section. The end of a code section is determined by the AREA directive at the beginning of the following section, or the end of the assembly.

These default literal pools can sometimes be out of range of some LDR, VLDR, and WLDR pseudo-instructions. Use LTORG to ensure that a literal pool is assembled within range.

Large programs can require several literal pools. Place LTORG directives after unconditional branches or subroutine return instructions so that the processor does not attempt to execute the constants as instructions.

The assembler word-aligns data in literal pools.

Example

```
AREA    Example, CODE, READONLY
start   BL      func1
        ; function body
        ; code
func1   LDR     r1,=0x55555555  ; => LDR R1, [pc, #offset to Literal Pool 1]
        ; code
        MOV     pc,lr           ; end function
        LTORG                   ; Literal Pool 1 contains literal &55555555.
        data     SPACE   4200            ; Clears 4200 bytes of memory,
        ; starting at current location.
        END                     ; Default literal pool is empty.
```

6.3.2 MAP

The MAP directive sets the origin of a storage map to a specified address. The storage-map location counter, \{VAR\}, is set to the same address. \& is a synonym for MAP.

Syntax

\texttt{MAP expr[,base-register]}

where:

\texttt{expr} is a numeric or PC-relative expression:

- If \texttt{base-register} is not specified, \texttt{expr} evaluates to the address where the storage map starts. The storage map location counter is set to this address.

- If \texttt{expr} is PC-relative, you must have defined the label before you use it in the map. The map requires the definition of the label during the first pass of the assembler.

\texttt{base-register} specifies a register. If \texttt{base-register} is specified, the address where the storage map starts is the sum of \texttt{expr}, and the value in \texttt{base-register} at runtime.

Usage

Use the MAP directive in combination with the FIELD directive to describe a storage map.

Specify \texttt{base-register} to define register-relative labels. The base register becomes implicit in all labels defined by following FIELD directives, until the next \texttt{MAP} directive. The register-relative labels can be used in load and store instructions.

The MAP directive can be used any number of times to define multiple storage maps.

The \{VAR\} counter is set to zero before the first MAP directive is used.

Examples

\begin{verbatim}
MAP     0,r9
MAP     0xff,r9
\end{verbatim}

See also

Concepts

- \textit{How the assembler works on page 2-4 in Using the Assembler}
- \textit{Directives that can be omitted in pass 2 of the assembler on page 2-6 in Using the Assembler.}

Reference

- \textit{FIELD on page 6-18.
6.3.3 FIELD

The FIELD directive describes space within a storage map that has been defined using the MAP directive. # is a synonym for FIELD.

Syntax

\{label\} FIELD expr

where:

label is an optional label. If specified, label is assigned the value of the storage location counter, \{VAR\}. The storage location counter is then incremented by the value of expr.

expr is an expression that evaluates to the number of bytes to increment the storage counter.

Usage

If a storage map is set by a MAP directive that specifies a base-register, the base register is implicit in all labels defined by following FIELD directives, until the next MAP directive. These register-relative labels can be quoted in load and store instructions.

Examples

The following example shows how register-relative labels are defined using the MAP and FIELD directives.

```
MAP 0, r9        ; set \{VAR\} to the address stored in R9
FIELD 4           ; increment \{VAR\} by 4 bytes
Lab FIELD 4       ; set Lab to the address [R9 + 4]
                   ; and then increment \{VAR\} by 4 bytes
LDR r0, Lab      ; equivalent to LDR r0,[r9,#4]
```

When using the MAP and FIELD directives, you must ensure that the values are consistent in both passes. The following example shows a use of MAP and FIELD that cause inconsistent values for the symbol x. In the first pass sym is not defined, so x is at 0x04+R9. In the second pass, sym is defined, so x is at 0x00+R0. This example results in an assembly error.

```
MAP 0, r0
if :LNOT: :DEF: sym
MAP 0, r9
    FIELD 4 ; x is at 0x04+R9 in first pass
ENDIF
x FIELD 4 ; x is at 0x00+R0 in second pass
sym LDR r0, x ; inconsistent values for x results in assembly error
```

Concepts

- *How the assembler works on page 2-4 in Using the Assembler*
- *Directives that can be omitted in pass 2 of the assembler on page 2-6 in Using the Assembler.*

Reference

- *MAP on page 6-17.*
6.3.4 SPACE or FILL

The SPACE directive reserves a zeroed block of memory. \% is a synonym for SPACE.

The FILL directive reserves a block of memory to fill with the given value.

Syntax

\{label\} \ SPACE \ expr
\{label\} \ FILL \ expr{,value}{,valuesize}\}

where:

* label is an optional label.
* expr evaluates to the number of bytes to fill or zero.
* value evaluates to the value to fill the reserved bytes with. value is optional and if omitted, it is 0. value must be 0 in a NOINIT area.
* valuesize is the size, in bytes, of value. It can be any of 1, 2, or 4. valuesize is optional and if omitted, it is 1.

Usage

Use the ALIGN directive to align any code following a SPACE or FILL directive.

Example

\AREA \ MyData, DATA, READWRITE
\ data1 \ SPACE \ 255 ; defines 255 bytes of zeroed store
\ data2 \ FILL \ 50,0xAB,1 ; defines 50 bytes containing 0xAB

• \ DCDO \ on page 6-22
• \ DCW \ and \ DCWU \ on page 6-27
• \ ALIGN \ on page 6-59.
6.3.5 DCB

The DCB directive allocates one or more bytes of memory, and defines the initial runtime contents of the memory. = is a synonym for DCB.

Syntax

```
{label} DCB expr{,expr}...
```

where:

- `expr` is either:
  - a numeric expression that evaluates to an integer in the range –128 to 255.
  - a quoted string. The characters of the string are loaded into consecutive bytes of store.

Usage

If DCB is followed by an instruction, use an ALIGN directive to ensure that the instruction is aligned.

Example

Unlike C strings, ARM assembler strings are not nul-terminated. You can construct a nul-terminated C string using DCB as follows:

```
c_string   DCB  "C_string",0
```

6.3.6  DCD and DCDU

The DCD directive allocates one or more words of memory, aligned on four-byte boundaries, and defines the initial runtime contents of the memory.

& is a synonym for DCD.

DCDU is the same, except that the memory alignment is arbitrary.

Syntax

\{label\}  DCD\{U\}  expr{,expr}

where:

expr  is either:

•  a numeric expression.
•  a PC-relative expression.

Usage

DCD inserts up to three bytes of padding before the first defined word, if necessary, to achieve four-byte alignment.

Use DCDU if you do not require alignment.

Examples

data1  DCD     1,5,20      ; Defines 3 words containing
                   ; decimal values 1, 5, and 20
data2  DCD     mem06 + 4   ; Defines 1 word containing 4 +
                   ; the address of the label mem06
AREA   MyData, DATA, READWRITE
DCB    255         ; Now misaligned ...
data3  DCDU    1,5,20      ; Defines 3 words containing
                   ; 1, 5 and 20, not word aligned

•  DCW and DCWU on page 6-27
•  DCQ and DCQU on page 6-26
•  SPACE or FILL on page 6-19.
6.3.7  DCDO

The DCDO directive allocates one or more words of memory, aligned on four-byte boundaries, and defines the initial runtime contents of the memory as an offset from the static base register, sb (R9).

Syntax

\{\texttt{label}\} \texttt{DCDO} \texttt{expr,expr} \ldots

where:

\texttt{expr} is a register-relative expression or label. The base register must be \texttt{sb}.

Usage

Use DCDO to allocate space in memory for static base register relative relocatable addresses.

Example

\begin{verbatim}
IMPORT externsym
DCDO externsym ; 32-bit word relocated by offset of
            ; externsym from base of SB section.
\end{verbatim}
6.3.8 DCFD and DCFDU

The DCFD directive allocates memory for word-aligned double-precision floating-point numbers, and defines the initial runtime contents of the memory. Double-precision numbers occupy two words and must be word aligned to be used in arithmetic operations.

DCFDU is the same, except that the memory alignment is arbitrary.

Syntax

\{label\} DCFD{U} \{fpliteral\}{,fpliteral}...

where:

fpliteral is a double-precision floating-point literal.

Usage

The assembler inserts up to three bytes of padding before the first defined number, if necessary, to achieve four-byte alignment.

Use DCFDU if you do not require alignment.

The word order used when converting fpliteral to internal form is controlled by the floating-point architecture selected. You cannot use DCFD or DCFDU if you select the --fpu none option.

The range for double-precision numbers is:

- maximum 1.79769313486231571e+308
- minimum 2.22507385850720138e−308.

Examples

<table>
<thead>
<tr>
<th></th>
<th>DCFD</th>
<th>DCFDU</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1E308</td>
<td>-4E-100</td>
</tr>
<tr>
<td></td>
<td>10000</td>
<td>-1.3.1E26</td>
</tr>
</tbody>
</table>

Concepts

Using the Assembler:

- Floating-point literals on page 8-18.

Reference

- DCFS and DCFSU on page 6-24.
6.3.9  DCFS and DCFSU

The DCFS directive allocates memory for word-aligned single-precision floating-point numbers, and defines the initial runtime contents of the memory. Single-precision numbers occupy one word and must be word aligned to be used in arithmetic operations.

DCFSU is the same, except that the memory alignment is arbitrary.

Syntax

\{\texttt{label}\} DCFS\{U\} \texttt{\texttt{fpliteral}}{,\texttt{\texttt{fpliteral}}}...

where:

\texttt{fpliteral} is a single-precision floating-point literal.

Usage

DCFS inserts up to three bytes of padding before the first defined number, if necessary to achieve four-byte alignment.

Use DCFSU if you do not require alignment.

The range for single-precision values is:

• maximum 3.40282347e+38
• minimum 1.17549435e–38.

Examples

\begin{verbatim}
DCFS    1E3,-4E-9
DCFSU   1.0,-.1,3.1E6
\end{verbatim}

See also

Concepts

Using the Assembler:

• Floating-point literals on page 8-18.

Reference

• DCFD and DCFDU on page 6-23.
6.3.10 DCI

In ARM code, the DCI directive allocates one or more words of memory, aligned on four-byte boundaries, and defines the initial runtime contents of the memory.

In Thumb code, the DCI directive allocates one or more halfwords of memory, aligned on two-byte boundaries, and defines the initial runtime contents of the memory.

Syntax

\{label\} DCI{.W} expr,expr

where:

- expr is a numeric expression.
- .W if present, indicates that four bytes must be inserted in Thumb code.

Usage

The DCI directive is very like the DCD or DCW directives, but the location is marked as code instead of data. Use DCI when writing macros for new instructions not supported by the version of the assembler you are using.

In ARM code, DCI inserts up to three bytes of padding before the first defined word, if necessary, to achieve four-byte alignment. In Thumb code, DCI inserts an initial byte of padding, if necessary, to achieve two-byte alignment.

You can use DCI to insert a bit pattern into the instruction stream. For example, use:

DCI 0x46c0

to insert the Thumb operation MOV r8,r8.

Example macro

MACRO
    ; this macro translates newinstr Rd,Rm
    ; to the appropriate machine code
    newinst $Rd,$Rm
    DCI 0xe16f0f10 :OR: ($Rd:SHL:12) :OR: $Rm
MEND

32-bit Thumb example

DCI.W 0xf3af8000 ; inserts 32-bit NOP, 2-byte aligned.

See also

Concepts

Using the Assembler:
- Numeric expressions on page 8-16.

Reference

- DCD and DCDU on page 6-21
- DCW and DCWU on page 6-27.
6.3.11 DCQ and DCQU

The DCQ directive allocates one or more eight-byte blocks of memory, aligned on four-byte boundaries, and defines the initial runtime contents of the memory.

DCQU is the same, except that the memory alignment is arbitrary.

Syntax

{label} DCQ{U} {-->} literal{,-->} literal...

where:

- literal is a 64-bit numeric literal.
- The range of numbers permitted is 0 to $2^{64}-1$.
- In addition to the characters normally permitted in a numeric literal, you can prefix literal with a minus sign. In this case, the range of numbers permitted is $-2^{63}$ to $-1$.
- The result of specifying -$n$ is the same as the result of specifying $2^{64}-n$.

Usage

DCQ inserts up to three bytes of padding before the first defined eight-byte block, if necessary, to achieve four-byte alignment.

Use DCQU if you do not require alignment.

Examples

```
AREA MiscData, DATA, READWRITE
data    DCQ  -225,2_101 ; 2_101 means binary 101.
          DCQU number+4 ; number must already be defined.
```

Concepts

Using the Assembler:

- Numeric literals on page 8-17.

Reference

- DCB on page 6-20
- DCD and DCDU on page 6-21
- DCW and DCWU on page 6-27
- SPACE or FILL on page 6-19.
6.3.12 DCW and DCWU

The DCW directive allocates one or more halfwords of memory, aligned on two-byte boundaries, and defines the initial runtime contents of the memory.

DCWU is the same, except that the memory alignment is arbitrary.

Syntax

{label} DCW{U} expr{,expr}...

where:

expr is a numeric expression that evaluates to an integer in the range –32768 to 65535.

Usage

DCW inserts a byte of padding before the first defined halfword if necessary to achieve two-byte alignment.

Use DCWU if you do not require alignment.

Examples

data    DCW     -225,2*number   ; number must already be defined
          DCWU    number+4

See also

Concepts

Using the Assembler:

• Numeric expressions on page 8-16.

Reference

• DCB on page 6-20
• DCD and DCDU on page 6-21
• DCQ and DCQU on page 6-26
• SPACE or FILL on page 6-19.
6.3.13 COMMON

The COMMON directive allocates a block of memory, of the defined size, at the specified symbol. You specify how the memory is aligned. If alignment is omitted, the default alignment is 4. If size is omitted, the default size is 0.

You can access this memory as you would any other memory, but no space is allocated in object files.

Syntax

```COMMON symbol{,size{,alignment} } { [attr] }```

where:

- `symbol` is the symbol name. The symbol name is case-sensitive.
- `size` is the number of bytes to reserve.
- `alignment` is the alignment.
- `attr` can be any one of:
  - `DYNAMIC` sets the ELF symbol visibility to STV_DEFAULT.
  - `PROTECTED` sets the ELF symbol visibility to STV_PROTECTED.
  - `HIDDEN` sets the ELF symbol visibility to STV_HIDDEN.
  - `INTERNAL` sets the ELF symbol visibility to STV_INTERNAL.

Usage

The linker allocates the required space as zero initialized memory during the link stage. You cannot define, IMPORT or EXTERN a symbol that has already been created by the COMMON directive. In the same way, if a symbol has already been defined or used with the IMPORT or EXTERN directive, you cannot use the same symbol for the COMMON directive.

Example

```LDR  r0, =xyz
COMMON xyz, 255, 4 ; defines 255 bytes of ZI store, word-aligned```

Incorrect examples

```COMMON foo, 4, 4
COMMON bar, 4, 4
foo DCD 0 ; cannot define label with same name as COMMON
IMPORT bar ; cannot import label with same name as COMMON```

6.3.14 DATA

The DATA directive is no longer required. It is ignored by the assembler.
6.4 Assembly control directives

This section describes the following directives to control conditional assembly, looping, inclusions, and macros:

- MACRO and MEND on page 6-30
- MEXIT on page 6-33
- IF, ELSE, ENDF, and ELIF on page 6-34
- WHILE and WEND on page 6-36.

6.4.1 Nesting directives

The following structures can be nested to a total depth of 256:

- MACRO definitions
- WHILE...WEND loops
- IF...ELSE...ENDIF conditional structures
- INCLUDE file inclusions.

The limit applies to all structures taken together, regardless of how they are nested. The limit is not 256 of each type of structure.
6.4.2 MACRO and MEND

The MACRO directive marks the start of the definition of a macro. Macro expansion terminates at the MEND directive.

Syntax

Two directives are used to define a macro. The syntax is:

```
MACRO
{$label} macroname{$cond} {$parameter{,$parameter}...}
; code
MEND
```

where:

- `$label` is a parameter that is substituted with a symbol given when the macro is invoked. The symbol is usually a label.
- `macroname` is the name of the macro. It must not begin with an instruction or directive name.
- `$cond` is a special parameter designed to contain a condition code. Values other than valid condition codes are permitted.
- `$parameter` is a parameter that is substituted when the macro is invoked. A default value for a parameter can be set using this format:
  ```
  $parameter="default value"
  ```
  Double quotes must be used if there are any spaces within, or at either end of, the default value.

Usage

If you start any WHILE...WEND loops or IF...ENDIF conditions within a macro, they must be closed before the MEND directive is reached. You can use MEXIT to enable an early exit from a macro, for example, from within a loop.

Within the macro body, parameters such as `$label`, `$parameter` or `$cond` can be used in the same way as other variables. They are given new values each time the macro is invoked. Parameters must begin with $ to distinguish them from ordinary symbols. Any number of parameters can be used.

 `$label` is optional. It is useful if the macro defines internal labels. It is treated as a parameter to the macro. It does not necessarily represent the first instruction in the macro expansion. The macro defines the locations of any labels.

Use | as the argument to use the default value of a parameter. An empty string is used if the argument is omitted.

In a macro that uses several internal labels, it is useful to define each internal label as the base label with a different suffix.

Use a dot between a parameter and following text, or a following parameter, if a space is not required in the expansion. Do not use a dot between preceding text and a parameter.

You can use the `$cond` parameter for condition codes. Use the unary operator :REVERSE_CC: to find the inverse condition code, and :CC_ENCODING: to find the 4-bit encoding of the condition code.

Macros define the scope of local variables.
Macros can be nested.

**Examples**

```asm
; macro definition
MACRO                 ; start macro definition
$label                 ; code
MACRO                 ; end macro definition
$label                 ; code
BL    $p1
BGT    $label
; code
MACRO                 ; start macro definition
$label                 ; code
BL    $p1
BGT    $label
; code
MACRO                 ; end macro definition
$label                 ; code
```

Using a macro to produce assembly-time diagnostics:

```asm
MACRO
   diagnose $param1="default" ; This macro produces
   INFO   0,"$param1" ; assembly-time diagnostics
   MEND ; (on second assembly pass)
```

**Note**

When variables are also being passed in as arguments, use of | might leave some variables unsubstituted. To workaround this, define the | in a LCLS or GBLS variable and pass this variable as an argument instead of |. For example:

```asm
MACRO
   m2 $a,$b=r1,$c ; The default value for $b is r1
   add $a,$b,$c ; The macro adds $b and $c and puts result in $a
   MEND ; Macro end
```

```asm
MACRO
   m1 $a,$b ; This macro adds $b to r1 and puts result in $a
```

```asm
LCLS def ; Declare a local string variable for |
SETS "|
```
Conditional macro example

AREA   codx, CODE, READONLY

; macro definition

MACRO
Return$cond
  [ {ARCHITECTURE} <> "4"
    BX$cond lr
  |    MOV$cond pc,lr
  ]
MEND

; macro invocation

fun     PROC
  CMP    r0,#0
  MOVEQ  r0,#1
  ReturnEQ
  MOV    r0,#0
  Return
ENDP

END

• Nesting directives on page 6-29
• GBLA, GBLL, and GBLS on page 6-4
• LCLA, LCLL, and LCLS on page 6-6.
6.4.3 MEXIT

The MEXIT directive is used to exit a macro definition before the end.

Usage

Use MEXIT when you require an exit from within the body of a macro. Any unclosed WHILE...WEND loops or IF...ENDIF conditions within the body of the macro are closed by the assembler before the macro is exited.

Example

MACRO $abc example abc $param1,$param2
; code
  WHILE condition1
    ; code
    IF condition2
      ; code
      MEXIT
    ELSE
      ; code
      ENDIF
  WEND
; code
MEND

See also

Reference

• MACRO and MEND on page 6-30.
6.4.4 IF, ELSE, ENDIF, and ELIF

The IF directive introduces a condition that is used to decide whether to assemble a sequence of instructions and directives. [ ] is a synonym for IF.

The ELSE directive marks the beginning of a sequence of instructions or directives that you want to be assembled if the preceding condition fails. [ ] is a synonym for ELSE.

The ENDIF directive marks the end of a sequence of instructions or directives that you want to be conditionally assembled. [ ] is a synonym for ENDIF.

The ELIF directive creates a structure equivalent to ELSE IF, without the requirement for nesting or repeating the condition.

**Syntax**

```
IF logical-expression ;code
  {ELSE ;code}
ENDIF
```

where:

- `logical-expression` is an expression that evaluates to either {TRUE} or {FALSE}.

**Usage**

Use IF with ENDIF, and optionally with ELSE, for sequences of instructions or directives that are only to be assembled or acted on under a specified condition.

IF...ENDIF conditions can be nested.

**Using ELIF**

Without using ELIF, you can construct a nested set of conditional instructions like this:

```
IF logical-expression
  instructions
ELSE
  IF logical-expression2
    instructions
ELSE
    IF logical-expression3
      instructions
  ENDIF
ENDIF
ENDIF
```

A nested structure like this can be nested up to 256 levels deep.

You can write the same structure more simply using ELIF:

```
IF logical-expression
  instructions
ELIF logical-expression2
  instructions
ELIF logical-expression3
  instructions
ENDIF
```

This structure only adds one to the current nesting depth, for the IF...ENDIF pair.
Examples

Example 6-3 assembles the first set of instructions if NEWVERSION is defined, or the alternative set otherwise.

Example 6-3 Assembly conditional on a variable being defined

```plaintext
IF :DEF:NEWVERSION
    ; first set of instructions or directives
ELSE
    ; alternative set of instructions or directives
ENDIF
```

Invoking armasm as follows defines NEWVERSION, so the first set of instructions and directives are assembled:

```plaintext
armasm --predefine "NEWVERSION SETL {TRUE}" test.s
```

Invoking armasm as follows leaves NEWVERSION undefined, so the second set of instructions and directives are assembled:

```plaintext
armasm test.s
```

Example 6-4 assembles the first set of instructions if NEWVERSION has the value {TRUE}, or the alternative set otherwise.

Example 6-4 Assembly conditional on a variable value

```plaintext
IF NEWVERSION = {TRUE}
    ; first set of instructions or directives
ELSE
    ; alternative set of instructions or directives
ENDIF
```

Invoking armasm as follows causes the first set of instructions and directives to be assembled:

```plaintext
armasm --predefine "NEWVERSION SETL {TRUE}" test.s
```

Invoking armasm as follows causes the second set of instructions and directives to be assembled:

```plaintext
armasm --predefine "NEWVERSION SETL {FALSE}" test.s
```

Concepts

Using the Assembler:
- Relational operators on page 8-27.

Reference
- Using ELIF on page 6-34
- Nesting directives on page 6-29.
6.4.5 WHILE and WEND

The WHILE directive starts a sequence of instructions or directives that are to be assembled repeatedly. The sequence is terminated with a WEND directive.

Syntax

WHILE logical-expression
code
WEND

where:

logical-expression
is an expression that can evaluate to either {TRUE} or {FALSE}.

Usage

Use the WHILE directive, together with the WEND directive, to assemble a sequence of instructions a number of times. The number of repetitions can be zero.

You can use IF...ENDIF conditions within WHILE...WEND loops.

WHILE...WEND loops can be nested.

Example

GBLA count ; declare local variable
count     SETA    1                   ; you are not restricted to
WHILE   count <= 4          ; such simple conditions
        count   SETA    count+1             ; In this case,
                   ; code                  ; this code will be
                   ; code                  ; repeated four times
        WEND

Reference
• Nesting directives on page 6-29.
6.5 Frame directives

This section describes the following directives:
- 
  FRAME ADDRESS on page 6-38
- 
  FRAME POP on page 6-39
- 
  FRAME PUSH on page 6-40
- 
  FRAME REGISTER on page 6-41
- 
  FRAME RESTORE on page 6-42
- 
  FRAME RETURN ADDRESS on page 6-43
- 
  FRAME SAVE on page 6-44
- 
  FRAME STATE REMEMBER on page 6-45
- 
  FRAME STATE RESTORE on page 6-46
- 
  FRAME UNWIND ON on page 6-47
- 
  FRAME UNWIND OFF on page 6-47
- 
  FUNCTION or PROC on page 6-47
- 
  ENDFUNC or ENDP on page 6-49.

Correct use of these directives:
- enables the arm\link --callgraph option to calculate stack usage of assembler functions.
  The following rules are used to determine stack usage:
  — If a function is not marked with \texttt{PROC} or \texttt{ENDP}, stack usage is unknown.
  — If a function is marked with \texttt{PROC} or \texttt{ENDP} but with no \texttt{FRAME PUSH} or \texttt{FRAME POP}, stack
    usage is assumed to be zero. This means that there is no requirement to manually add
    \texttt{FRAME PUSH 0} or \texttt{FRAME POP 0}.
  — If a function is marked with \texttt{PROC} or \texttt{ENDP} and with \texttt{FRAME PUSH n} or \texttt{FRAME POP n}, stack
    usage is assumed to be \texttt{n} bytes.
- helps you to avoid errors in function construction, particularly when you are modifying
  existing code
- enables the assembler to alert you to errors in function construction
- enables backtracing of function calls during debugging
- enables the debugger to profile assembler functions.

If you require profiling of assembler functions, but do not want frame description directives for
other purposes:
- you must use the \texttt{FUNCTION} and \texttt{ENDFUNC}, or \texttt{PROC} and \texttt{ENDP}, directives
- you can omit the other \texttt{FRAME} directives
- you only have to use the \texttt{FUNCTION} and \texttt{ENDFUNC} directives for the functions you want to
  profile.

In DWARF, the canonical frame address is an address on the stack specifying where the call
frame of an interrupted function is located.
6.5.1 FRAME ADDRESS

The FRAME ADDRESS directive describes how to calculate the canonical frame address for following instructions. You can only use it in functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

FRAME ADDRESS reg[,offset]

where:

reg is the register on which the canonical frame address is to be based. This is SP unless the function uses a separate frame pointer.

offset is the offset of the canonical frame address from reg. If offset is zero, you can omit it.

Usage

Use FRAME ADDRESS if your code alters which register the canonical frame address is based on, or if it changes the offset of the canonical frame address from the register. You must use FRAME ADDRESS immediately after the instruction that changes the calculation of the canonical frame address.

Note

If your code uses a single instruction to save registers and alter the stack pointer, you can use FRAME PUSH instead of using both FRAME ADDRESS and FRAME SAVE.

If your code uses a single instruction to load registers and alter the stack pointer, you can use FRAME POP instead of using both FRAME ADDRESS and FRAME RESTORE.

Example

_fn FUNCTION ; CFA (Canonical Frame Address) is value ; of SP on entry to function
PUSH {r4,fp,ip,lr,pc}
FRAME PUSH {r4,fp,ip,lr,pc}
SUB sp,sp,#4 ; CFA offset now changed
FRAME ADDRESS sp,24 ; - so we correct it
ADD fp,sp,#20
FRAME ADDRESS fp,4 ; New base register
; code using fp to base call-frame on, instead of SP

See also

Reference

• FRAME POP on page 6-39
• FRAME PUSH on page 6-40.
6.5.2 FRAME POP

Use the `FRAME POP` directive to inform the assembler when the callee reloads registers. You can only use it within functions with `FUNCTION` and `ENDFUNC` or `PROC` and `ENDP` directives.

You do not have to do this after the last instruction in a function.

Syntax

There are three alternative syntaxes for `FRAME POP`:

- `FRAME POP {reglist}`
- `FRAME POP {reglist}, n`
- `FRAME POP n`

where:

- `reglist` is a list of registers restored to the values they had on entry to the function. There must be at least one register in the list.
- `n` is the number of bytes that the stack pointer moves.

Usage

`FRAME POP` is equivalent to a `FRAME ADDRESS` and a `FRAME RESTORE` directive. You can use it when a single instruction loads registers and alters the stack pointer.

You must use `FRAME POP` immediately after the instruction it refers to.

If `n` is not specified or is zero, the assembler calculates the new offset for the canonical frame address from `{reglist}`. It assumes that:

- each ARM register popped occupies four bytes on the stack
- each VFP single-precision register popped occupies four bytes on the stack, plus an extra four-byte word for each list
- each VFP double-precision register popped occupies eight bytes on the stack, plus an extra four-byte word for each list.

See also

Reference

- `FRAME ADDRESS` on page 6-38
- `FRAME RESTORE` on page 6-42.
6.5.3 FRAME PUSH

Use the FRAME PUSH directive to inform the assembler when the callee saves registers, normally at function entry. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

There are two alternative syntaxes for FRAME PUSH:

```
FRAME PUSH {reglist}
FRAME PUSH {reglist}, n
FRAME PUSH n
```

where:

- `reglist` is a list of registers stored consecutively below the canonical frame address. There must be at least one register in the list.
- `n` is the number of bytes that the stack pointer moves.

Usage

FRAME PUSH is equivalent to a FRAME ADDRESS and a FRAME SAVE directive. You can use it when a single instruction saves registers and alters the stack pointer.

You must use FRAME PUSH immediately after the instruction it refers to.

If `n` is not specified or is zero, the assembler calculates the new offset for the canonical frame address from `{reglist}`. It assumes that:

- each ARM register pushed occupies four bytes on the stack
- each VFP single-precision register pushed occupies four bytes on the stack, plus an extra four-byte word for each list
- each VFP double-precision register popped occupies eight bytes on the stack, plus an extra four-byte word for each list.

Example

```
p PROC ; Canonical frame address is SP + 0
EXPORT  p
PUSH    {r4-r6,lr}
 ; SP has moved relative to the canonical frame address, 
 ; and registers R4, R5, R6 and LR are now on the stack
FRAME PUSH {r4-r6,lr}
 ; Equivalent to:
 ; FRAME ADDRESS    sp,16       ; 16 bytes in {R4-R6,LR}
 ; FRAME SAVE    {r4-r6,lr},-16
```

See also

Reference

- `FRAME ADDRESS` on page 6-38
- `FRAME SAVE` on page 6-44.
6.5.4 FRAME REGISTER

Use the FRAME REGISTER directive to maintain a record of the locations of function arguments held in registers. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

FRAME REGISTER reg1, reg2

where:

reg1 is the register that held the argument on entry to the function.

reg2 is the register in which the value is preserved.

Usage

Use the FRAME REGISTER directive when you use a register to preserve an argument that was held in a different register on entry to a function.
6.5.5 FRAME RESTORE

Use the FRAME RESTORE directive to inform the assembler that the contents of specified registers have been restored to the values they had on entry to the function. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

FRAME RESTORE {reglist}

where:

reglist is a list of registers whose contents have been restored. There must be at least one register in the list.

Usage

Use FRAME RESTORE immediately after the callee reloads registers from the stack. You do not have to do this after the last instruction in a function.

reglist can contain integer registers or floating-point registers, but not both.

——— Note ————

If your code uses a single instruction to load registers and alter the stack pointer, you can use FRAME POP instead of using both FRAME RESTORE and FRAME ADDRESS.

See also

Reference

• FRAME POP on page 6-39.
6.5.6 FRAME RETURN ADDRESS

The FRAME RETURN ADDRESS directive provides for functions that use a register other than LR for their return address. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

--- Note ---

Any function that uses a register other than LR for its return address is not AAPCS compliant. Such a function must not be exported.

---

Syntax

FRAME RETURN ADDRESS reg

where:

reg is the register used for the return address.

Usage

Use the FRAME RETURN ADDRESS directive in any function that does not use LR for its return address. Otherwise, a debugger cannot backtrace through the function.

Use FRAME RETURN ADDRESS immediately after the FUNCTION or PROC directive that introduces the function.
6.5.7 FRAME SAVE

The FRAME SAVE directive describes the location of saved register contents relative to the canonical frame address. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

```FRAME SAVE {reglist}, offset```

where:

```reglist```

is a list of registers stored consecutively starting at ```offset``` from the canonical frame address. There must be at least one register in the list.

Usage

Use `FRAME SAVE` immediately after the callee stores registers onto the stack.

`reglist` can include registers which are not required for backtracing. The assembler determines which registers it requires to record in the DWARF call frame information.

--- Note ---

If your code uses a single instruction to save registers and alter the stack pointer, you can use `FRAME PUSH` instead of using both `FRAME SAVE` and `FRAME ADDRESS`.

---

See also

Reference

- `FRAME PUSH` on page 6-40.
6.5.8 FRAME STATE REMEMBER

The FRAME STATE REMEMBER directive saves the current information on how to calculate the canonical frame address and locations of saved register values. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax
FRAME STATE REMEMBER

Usage
During an inline exit sequence the information about calculation of canonical frame address and locations of saved register values can change. After the exit sequence another branch can continue using the same information as before. Use FRAME STATE REMEMBER to preserve this information, and FRAME STATE RESTORE to restore it.

These directives can be nested. Each FRAME STATE RESTORE directive must have a corresponding FRAME STATE REMEMBER directive.

Example

; function code
FRAME STATE REMEMBER
; save frame state before in-line exit sequence
POP {r4-r6,pc}
; do not have to FRAME POP here, as control has transferred out of the function
FRAME STATE RESTORE
; end of exit sequence, so restore state
exitB ; code for exitB
POP {r4-r6,pc}
ENDP

See also

Reference
- FRAME STATE RESTORE on page 6-46
- FUNCTION or PROC on page 6-47.
6.5.9 FRAME STATE RESTORE

The FRAME STATE RESTORE directive restores information about how to calculate the canonical frame address and locations of saved register values. You can only use it within functions with FUNCTION and ENDFUNC or PROC and ENDP directives.

Syntax

FRAME STATE RESTORE

See also

Reference

• FRAME STATE REMEMBER on page 6-45
• FUNCTION or PROC on page 6-47.
6.5.10 FRAME UNWIND ON

The FRAME UNWIND ON directive instructs the assembler to produce unwind tables for this and subsequent functions.

**Syntax**

FRAME UNWIND ON

**Usage**

You can use this directive outside functions. In this case, the assembler produces unwind tables for all following functions until it reaches a FRAME UNWIND OFF directive.

**Note**

A FRAME UNWIND directive is not sufficient to turn on exception table generation. Furthermore a FRAME UNWIND directive, without other FRAME directives, is not sufficient information for the assembler to generate the unwind information.

**See also**

**Reference**

- --exceptions on page 2-13
- --exceptions_unwind on page 2-13.

6.5.11 FRAME UNWIND OFF

The FRAME UNWIND OFF directive instructs the assembler to produce nounwind tables for this and subsequent functions.

**Syntax**

FRAME UNWIND OFF

**Usage**

You can use this directive outside functions. In this case, the assembler produces nounwind tables for all following functions until it reaches a FRAME UNWIND ON directive.

**See also**

**Reference**

- --exceptions on page 2-13
- --exceptions_unwind on page 2-13.

6.5.12 FUNCTION or PROC

The FUNCTION directive marks the start of a function. PROC is a synonym for FUNCTION.

**Syntax**

```assembly
label FUNCTION [{reglist2} [, {reglist2}]]
```
where:

\textit{reglist1} is an optional list of callee saved ARM registers. If \textit{reglist1} is not present, and your debugger checks register usage, it will assume that the AAPCS is in use.

\textit{reglist2} is an optional list of callee saved VFP registers.

\textbf{Usage}

Use \texttt{FUNCTION} to mark the start of functions. The assembler uses \texttt{FUNCTION} to identify the start of a function when producing DWARF call frame information for ELF.

\texttt{FUNCTION} sets the canonical frame address to be R13 (SP), and the frame state stack to be empty.

Each \texttt{FUNCTION} directive must have a matching \texttt{ENDFUNC} directive. You must not nest \texttt{FUNCTION} and \texttt{ENDFUNC} pairs, and they must not contain \texttt{PROC} or \texttt{ENDP} directives.

You can use the optional \textit{reglist} parameters to inform the debugger about an alternative procedure call standard, if you are using your own. Not all debuggers support this feature. See your debugger documentation for details.

\textbf{Note}

\texttt{FUNCTION} does not automatically cause alignment to a word boundary (or halfword boundary for Thumb). Use \texttt{ALIGN} if necessary to ensure alignment, otherwise the call frame might not point to the start of the function.
Examples

ALIGN ; ensures alignment
dadd FUNCTION ; without the ALIGN directive, this might not be word-aligned
EXPORT dadd
PUSH {r4-r6,lr}; this line automatically word-aligned
FRAME PUSH {r4-r6,lr}
; subroutine body
POP {r4-r6,pc}
ENDFUNC

func6 PROC {r4-r8,r12},{D1-D3}; non-AAPCS-conforming function
   ...
ENDP

See also

Reference
• FRAME ADDRESS on page 6-38
• FRAME STATE RESTORE on page 6-46
• ALIGN on page 6-59.

6.5.13 ENDFUNC or ENDP

The ENDFUNC directive marks the end of an AAPCS-conforming function. ENDP is a synonym for ENDFUNC.

See also

Reference
• FUNCTION or PROC on page 6-47.
6.6 Reporting directives

This section describes the following directives:

- **ASSERT**
  generates an error message if an assertion is false during assembly.

- **INFO on page 6-51**
  generates diagnostic information during assembly.

- **OPT on page 6-52**
  sets listing options.

- **TTL and SUBT on page 6-54**
  insert titles and subtitles in listings.

6.6.1 ASSERT

The ASSERT directive generates an error message during assembly if a given assertion is false.

**Syntax**

```assert
ASSERT logical-expression
```

where:

`logical-expression`

is an assertion that can evaluate to either {TRUE} or {FALSE}.

**Usage**

Use ASSERT to ensure that any necessary condition is met during assembly.

If the assertion is false an error message is generated and assembly fails.

**Example**

```asm
ASSERT label1 <= label2    ; Tests if the address
; represented by label1
; is <= the address
; represented by label2.
```

**See also**

**Reference**

- **INFO on page 6-51**.
6.6.2  INFO

The INFO directive supports diagnostic generation on either pass of the assembly. ! is very similar to INFO, but has less detailed reporting.

Syntax

INFO numeric-expression, string-expression{, severity}
where:

numeric-expression

is a numeric expression that is evaluated during assembly. If the expression evaluates to zero:
• no action is taken during pass one
• string-expression is printed as a warning during pass two if severity is 1
• string-expression is printed as a message during pass two if severity is 0 or not specified.

If the expression does not evaluate to zero:
• string-expression is printed as an error message and the assembly fails irrespective of whether severity is specified or not (non-zero values for severity are reserved in this case).

string-expression

is an expression that evaluates to a string.

severity

is an optional number that controls the severity of the message. Its value can be either 0 or 1. All other values are reserved.

Usage

INFO provides a flexible means of creating custom error messages.

Examples

INFO 0, "Version 1.0"
IF endofdata <= label1
  INFO 4, "Data overrun at label1"
ENDIF

See also

Concepts

Using the Assembler:
• Numeric expressions on page 8-16
• String expressions on page 8-14.

Reference
• ASSERT on page 6-50.
6.6.3 OPT

The OPT directive sets listing options from within the source code.

**Syntax**

OPT \( n \)

where:

\( n \) is the OPT directive setting. Table 6-2 lists valid settings.

<table>
<thead>
<tr>
<th>OPT ( n )</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Turns on normal listing.</td>
</tr>
<tr>
<td>2</td>
<td>Turns off normal listing.</td>
</tr>
<tr>
<td>4</td>
<td>Page throw. Issues an immediate form feed and starts a new page.</td>
</tr>
<tr>
<td>8</td>
<td>Resets the line number counter to zero.</td>
</tr>
<tr>
<td>16</td>
<td>Turns on listing for SET, GBL and LCL directives.</td>
</tr>
<tr>
<td>32</td>
<td>Turns off listing for SET, GBL and LCL directives.</td>
</tr>
<tr>
<td>64</td>
<td>Turns on listing of macro expansions.</td>
</tr>
<tr>
<td>128</td>
<td>Turns off listing of macro expansions.</td>
</tr>
<tr>
<td>256</td>
<td>Turns on listing of macro invocations.</td>
</tr>
<tr>
<td>512</td>
<td>Turns off listing of macro invocations.</td>
</tr>
<tr>
<td>1024</td>
<td>Turns on the first pass listing.</td>
</tr>
<tr>
<td>2048</td>
<td>Turns off the first pass listing.</td>
</tr>
<tr>
<td>4096</td>
<td>Turns on listing of conditional directives.</td>
</tr>
<tr>
<td>8192</td>
<td>Turns off listing of conditional directives.</td>
</tr>
<tr>
<td>16384</td>
<td>Turns on listing of MEND directives.</td>
</tr>
<tr>
<td>32768</td>
<td>Turns off listing of MEND directives.</td>
</tr>
</tbody>
</table>

**Usage**

Specify the \(--list=\) assembler option to turn on listing.

By default the \(--list=\) option produces a normal listing that includes variable declarations, macro expansions, call-conditioned directives, and MEND directives. The listing is produced on the second pass only. Use the OPT directive to modify the default listing options from within your code.

You can use OPT to format code listings. For example, you can specify a new page before functions and sections.
Example

AREA  Example, CODE, READONLY
start ; code
; code
BL    func1
; code
OPT 4 ; places a page break before func1
func1 ; code

See also

Reference

•  --list=file on page 2-17.
6.6.4 TTL and SUBT

The **TTL** directive inserts a title at the start of each page of a listing file. The title is printed on each page until a new **TTL** directive is issued.

The **SUBT** directive places a subtitle on the pages of a listing file. The subtitle is printed on each page until a new **SUBT** directive is issued.

**Syntax**

TTL title

SUBT subtitle

where:

*title*  
is the title.

*subtitle*  
is the subtitle.

**Usage**

Use the **TTL** directive to place a title at the top of the pages of a listing file. If you want the title to appear on the first page, the **TTL** directive must be on the first line of the source file.

Use additional **TTL** directives to change the title. Each new **TTL** directive takes effect from the top of the next page.

Use **SUBT** to place a subtitle at the top of the pages of a listing file. Subtitles appear in the line below the titles. If you want the subtitle to appear on the first page, the **SUBT** directive must be on the first line of the source file.

Use additional **SUBT** directives to change subtitles. Each new **SUBT** directive takes effect from the top of the next page.

**Examples**

```
TTL    First Title ; places a title on the first
       ; and subsequent pages of a
       ; listing file.
SUBT   First Subtitle ; places a subtitle on the
       ; second and subsequent pages
       ; of a listing file.
```
6.7 Instruction set and syntax selection directives

This section describes the following directives:

- ARM, THUMB, THUMBX, CODE16 and CODE32 on page 6-56.
6.7.1 ARM, THUMB, THUMBX, CODE16 and CODE32

The ARM directive and the CODE32 directive are synonyms. They instruct the assembler to interpret subsequent instructions as ARM instructions, using either the UAL or the pre-UAL ARM assembler language syntax.

The THUMB directive instructs the assembler to interpret subsequent instructions as Thumb instructions, using the UAL syntax.

The THUMBX directive instructs the assembler to interpret subsequent instructions as ThumbEE instructions, using the UAL syntax.

The CODE16 directive instructs the assembler to interpret subsequent instructions as Thumb instructions, using the pre-UAL assembly language syntax.

If necessary, these directives also insert up to three bytes of padding to align to the next word boundary for ARM, or up to one byte of padding to align to the next halfword boundary for Thumb or ThumbEE.

Syntax

ARM
THUMB
THUMBX
CODE16
CODE32

Usage

In files that contain code using different instruction sets:

• ARM must precede any ARM code. CODE32 is a synonym for ARM.
• THUMB must precede Thumb code written in UAL syntax.
• THUMBX must precede ThumbEE code written in UAL syntax.
• CODE16 must precede Thumb code written in pre-UAL syntax.

These directives do not assemble to any instructions. They also do not change the state. They only instruct the assembler to assemble ARM, Thumb, or ThumbEE instructions as appropriate, and insert padding if necessary.

Example

This example shows how ARM and THUMB can be used to switch state and assemble both ARM and Thumb instructions in a single area.

```assembly
AREA ToThumb, CODE, READONLY ; Name this block of code
ENTRY                           ; Mark first instruction to execute
ARM                             ; Subsequent instructions are ARM

start
  ADR     r0, into_thumb + 1    ; Processor starts in ARM state
  BX      r0                    ; Inline switch to Thumb state
  THUMB                           ; Subsequent instructions are Thumb

into_thumb
  MOV     r0, #10               ; New-style Thumb instructions
```
6.8 Miscellaneous directives

This section describes the following directives:

- \textit{ALIAS} on page 6-58
- \textit{ALIGN} on page 6-59
- \textit{AREA} on page 6-61
- \textit{ATTR} on page 6-64
- \textit{END} on page 6-65
- \textit{ENTRY} on page 6-65
- \textit{EQU} on page 6-66
- \textit{EXPORT or GLOBAL} on page 6-67
- \textit{EXPORTAS} on page 6-69
- \textit{GET or INCLUDE} on page 6-70
- \textit{IMPORT and EXTERN} on page 6-71
- \textit{INCBIN} on page 6-73
- \textit{KEEP} on page 6-74
- \textit{NOFP} on page 6-75
- \textit{REQUIRE} on page 6-75
- \textit{REQUIRE8 and PRESERVE8} on page 6-76
- \textit{ROUT} on page 6-77.
6.8.1 ALIAS

The ALIAS directive creates an alias for a symbol.

Syntax

ALIAS name, aliasname

where:

- **name** is the name of the symbol to create an alias for
- **aliasname** is the name of the alias to be created.

Usage

The symbol **name** must already be defined in the source file before creating an alias for it. Properties of **name** set by the EXPORT directive will not be inherited by **aliasname**, so you must use EXPORT on **aliasname** if you want to make the alias available outside the current source file. Apart from the properties set by the EXPORT directive, **name** and **aliasname** are identical.

Example

```
baz
bar PROC
  BX lr
ENDP
ALIAS bar,foo ; foo is an alias for bar
EXPORT bar
EXPORT foo ; foo and bar have identical properties
  ; because foo was created using ALIAS
EXPORT baz ; baz and bar are not identical
  ; because the size field of baz is not set
```

Incorrect example

```
EXPORT bar
IMPORT car
ALIAS bar,foo ; ERROR - bar is not defined yet
ALIAS car,boo ; ERROR - car is external
bar PROC
  BX lr
ENDP
```

See also

Reference

- [Data definition directives](#) on page 6-15
- [EXPORT or GLOBAL](#) on page 6-67.
6.8.2 ALIGN

The ALIGN directive aligns the current location to a specified boundary by padding with zeros or NOP instructions.

Syntax

ALIGN {expr{,offset{,pad{,padsize}}}}

where:

expr is a numeric expression evaluating to any power of 2 from $2^0$ to $2^{31}$

offset can be any numeric expression

pad can be any numeric expression

padsize can be 1, 2 or 4.

Operation

The current location is aligned to the next lowest address of the form:

$offset + n \times expr$

$n$ is any integer which the assembler selects to minimise padding.

If $expr$ is not specified, ALIGN sets the current location to the next word (four byte) boundary. The unused space between the previous and the new current location are filled with:

- copies of $pad$, if $pad$ is specified
- NOP instructions, if all the following conditions are satisfied:
  - $pad$ is not specified
  - the ALIGN directive follows ARM or Thumb instructions
  - the current section has the CODEALIGN attribute set on the AREA directive
- zeros otherwise.

$pad$ is treated as a byte, halfword, or word, according to the value of $padsize$. If $padsize$ is not specified, $pad$ defaults to bytes in data sections, halfwords in Thumb code, or words in ARM code.

Usage

Use ALIGN to ensure that your data and code is aligned to appropriate boundaries. This is typically required in the following circumstances:

- The ADR Thumb pseudo-instruction can only load addresses that are word aligned, but a label within Thumb code might not be word aligned. Use ALIGN 4 to ensure four-byte alignment of an address within Thumb code.
- Use ALIGN to take advantage of caches on some ARM processors. For example, the ARM940T has a cache with 16-byte lines. Use ALIGN 16 to align function entries on 16-byte boundaries and maximize the efficiency of the cache.
- LDRD and STRD doubleword data transfers must be eight-byte aligned. Use ALIGN 8 before memory allocation directives such as DCQ if the data is to be accessed using LDRD or STRD.
- A label on a line by itself can be arbitrarily aligned. Following ARM code is word-aligned (Thumb code is halfword aligned). The label therefore does not address the code correctly. Use ALIGN 4 (or ALIGN 2 for Thumb) before the label.
Alignment is relative to the start of the ELF section where the routine is located. The section must be aligned to the same, or coarser, boundaries. The ALIGN attribute on the AREA directive is specified differently.

**Examples**

```
AREA    cacheable, CODE, ALIGN=3
rout1   ; code ; aligned on 8-byte boundary
        ; code
        MOV     pc,lr ; aligned only on 4-byte boundary
        ALIGN   8     ; now aligned on 8-byte boundary
rout2   ; code
```

In the following example, the ALIGN directive tells the assembler that the next instruction is word aligned and offset by 3 bytes. The 3 byte offset is counted from the previous word aligned address, resulting in the second DCB placed in the last byte of the same word and 2 bytes of padding are to be added.

```
AREA    OffsetExample, CODE
DCB     1 ; This example places the two bytes in the first
ALIGN   4,3 ; and fourth bytes of the same word.
DCB     1 ; The second DCB is offset by 3 bytes from the first DCB
```

In the following example, the ALIGN directive tells the assembler that the next instruction is word aligned and offset by 2 bytes. Here, the 2 byte offset is counted from the next word aligned address, so the value \( n \) is set to 1 (\( n=0 \) clashes with the third DCB). This time three bytes of padding are to be added.

```
AREA    OffsetExample1, CODE
DCB     1 ; In this example, n cannot be 0 because it clashes with
DCB     1 ; the 3rd DCB. The assembler sets n to 1.
DCB     1
ALIGN   4,2 ; The next instruction is word aligned and offset by 2.
DCB     2
```

In the following example, the DCB directive makes the PC misaligned. The ALIGN directive ensures that the label subroutine1 and the following instruction are word aligned.

```
AREA    Example, CODE, READONLY
start   LDR     r6,=label1
        ; code
        MOV     pc,lr
        label1 DCB     1 ; PC now misaligned
ALIGN   ; ensures that subroutine1 addresses
subroutine1 ; the following instruction.
        MOV r5,#0x5
```

- *Examples.*
### 6.8.3 AREA

The `AREA` directive instructs the assembler to assemble a new code or data section. Sections are independent, named, indivisible chunks of code or data that are manipulated by the linker.

#### Syntax

```
AREA sectionname{,attr}{,attr}...
```

where:

- `sectionname` is the name to give to the section.

  You can choose any name for your sections. However, names starting with a non-alphabetic character must be enclosed in bars or a missing section name error is generated. For example, `|1_DataArea|`.

  Certain names are conventional. For example, `.text` is used for code sections produced by the C compiler, or for code sections otherwise associated with the C library.

- `attr` are one or more comma-delimited section attributes. Valid attributes are:
  - **ALIGN=expression**
    
    By default, ELF sections are aligned on a four-byte boundary. `expression` can have any integer value from 0 to 31. The section is aligned on a \(2^{expression}\)-byte boundary. For example, if `expression` is 10, the section is aligned on a 1KB boundary.
    
    *This is not the same as the way that the ALIGN directive is specified.*
    
    **Note**
    
    Do not use `ALIGN=0` or `ALIGN=1` for ARM code sections.
    
    Do not use `ALIGN=0` for Thumb code sections.
    
  - **ASSOC=section**
    
    `section` specifies an associated ELF section. `sectionname` must be included in any link that includes `section`.
    
  - **CODE**
    
    Contains machine instructions. `READONLY` is the default.
    
  - **CODEALIGN**
    
    Causes the assembler to insert `NOP` instructions when the `ALIGN` directive is used after ARM or Thumb instructions within the section, unless the `ALIGN` directive specifies a different padding.
    
  - **COMDEF**
    
    Is a common section definition. This ELF section can contain code or data. It must be identical to any other section of the same name in other source files.
    
    Identical ELF sections with the same name are overlaid in the same section of memory by the linker. If any are different, the linker generates a warning and does not overlay the sections.
    
  - **COMGROUP=symbol_name**
    
    Is the signature that makes the `AREA` part of the named ELF section group. See the `GROUP=symbol_name` for more information. The `COMGROUP` attribute marks the ELF section group with the `GRP_COMDAT` flag.
COMMON Is a common data section. You must not define any code or data in it. It is initialized to zeros by the linker. All common sections with the same name are overlaid in the same section of memory by the linker. They do not all have to be the same size. The linker allocates as much space as is required by the largest common section of each name.

DATA Contains data, not instructions. READWRITE is the default.

FINI_ARRAY Sets the ELF type of the current area to SHT_FINI_ARRAY.

GROUP=symbol_name Is the signature that makes the AREA part of the named ELF section group. It must be defined by the source file, or a file included by the source file. All AREAS with the same symbol_name signature are part of the same group. Sections within a group are kept or discarded together.

INIT_ARRAY Sets the ELF type of the current area to SHT_INIT_ARRAY.

LINKORDER=section Specifies a relative location for the current section in the image. It ensures that the order of all the sections with the LINKORDER attribute, with respect to each other, is the same as the order of the corresponding named sections in the image.

MERGE=n Indicates that the linker can merge the current section with other sections with the MERGE=n attribute. n is the size of the elements in the section, for example n is 1 for characters. You must not assume that the section will be merged because the attribute does not force the linker to merge the sections.

NOALLOC Indicates that no memory on the target system is allocated to this area.

NOINIT Indicates that the data section is uninitialized, or initialized to zero. It contains only space reservation directives SPACE or DCB, DCD, DCDU, DCQ, DCQU, DCW, or DCWU with initialized values of zero. You can decide at link time whether an area is uninitialized or zero initialized.

PREINIT_ARRAY Sets the ELF type of the current area to SHT_PREINIT_ARRAY.

READONLY Indicates that this section must not be written to. This is the default for Code areas.

READWRITE Indicates that this section can be read from and written to. This is the default for Data areas.

SECFLAGS=n Adds one or more ELF flags, denoted by n, to the current section.

SECTYPE=n Sets the ELF type of the current section to n.

STRINGS Adds the SHF_STRINGS flag to the current section. To use the STRINGS attribute, you must also use the MERGE=1 attribute. The contents of the section must be strings that are nul-terminated using the DCB directive.
Usage

Use the AREA directive to subdivide your source file into ELF sections. You can use the same name in more than one AREA directive. All areas with the same name are placed in the same ELF section. Only the attributes of the first AREA directive of a particular name are applied.

You should normally use separate ELF sections for code and data. However, you can put data in code sections. Large programs can usually be conveniently divided into several code sections. Large independent data sets are also usually best placed in separate sections.

The scope of local labels is defined by AREA directives, optionally subdivided by ROUT directives.

There must be at least one AREA directive for an assembly.

Note

The assembler emits R_ARM_TARGET1 relocations for the DCD and DCDU directives if the directive uses PC-relative expressions and is in any of the PREINIT_ARRAY, FINI_ARRAY, or INIT_ARRAY ELF sections. You can override the relocation using the RELOC directive after each DCD or DCDU directive. If this relocation is used, read-write sections might become read-only sections at link time if the platform ABI permits this.

Example

The following example defines a read-only code section named Example.

```
AREA Example,CODE,READONLY ; An example code section.
; code
```

6.8.4 ATTR

The ATTR set directives set values for the ABI build attributes.
The ATTR scope directives specify the scope for which the set value applies to.

Syntax

ATTR FILESCOPE

ATTR SCOPE name

ATTR settype tagid, value

where:

name is a section name or symbol name.

settype can be any of:

- SETVALUE
- SETSTRING
- SETCOMPATIBLEWITHVALUE
- SETCOMPATIBLEWITHSTRING

tagid is an attribute tag name (or its numerical value) defined in the ABI for the ARM Architecture.

value depends on settype:

- is a 32-bit integer value when settype is SETVALUE or SETCOMPATIBLEWITHVALUE
- is a nul-terminated string when settype is SETSTRING or SETCOMPATIBLEWITHSTRING

Usage

The ATTR set directives following the ATTR FILESCOPE directive apply to the entire object file. The ATTR set directives following the ATTR SCOPE name directive apply only to the named section or symbol.

For tags that expect an integer, you must use SETVALUE or SETCOMPATIBLEWITHVALUE. For tags that expect a string, you must use SETSTRING or SETCOMPATIBLEWITHSTRING.

Use SETCOMPATIBLEWITHVALUE and SETCOMPATIBLEWITHSTRING to set tag values which the object file is also compatible with.

Examples

ATTR SETSTRING Tag_CPU_raw_name, "Cortex-A8"
ATTR SETVALUE Tag_VFP_arch, 3 ; VFPv3 instructions were permitted.
ATTR SETVALUE 10, 3 ; 10 is the numerical value of Tag_VFP_arch.

Reference
- Addenda to, and Errata in, the ABI for the ARM Architecture,
6.8.5 END

The END directive informs the assembler that it has reached the end of a source file.

Syntax

END

Usage

Every assembly language source file must end with END on a line by itself.

If the source file has been included in a parent file by a GET directive, the assembler returns to the parent file and continues assembly at the first line following the GET directive.

If END is reached in the top-level source file during the first pass without any errors, the second pass begins.

If END is reached in the top-level source file during the second pass, the assembler finishes the assembly and writes the appropriate output.

See also

Reference

• GET or INCLUDE on page 6-70.

6.8.6 ENTRY

The ENTRY directive declares an entry point to a program.

Syntax

ENTRY

Usage

You must specify at least one ENTRY point for a program. If no ENTRY exists, a warning is generated at link time.

You must not use more than one ENTRY directive in a single source file. Not every source file has to have an ENTRY directive. If more than one ENTRY exists in a single source file, an error message is generated at assembly time.

Example

    AREA ARMex, CODE, READONLY
    ENTRY ; Entry point for the application
6.8.7 EQU

The EQU directive gives a symbolic name to a numeric constant, a register-relative value or a PC-relative value. * is a synonym for EQU.

Syntax

\[ \text{name} \text{ EQU } \text{expr}[, \text{type}] \]

where:

- \text{name} is the symbolic name to assign to the value.
- \text{expr} is a register-relative address, a PC-relative address, an absolute address, or a 32-bit integer constant.
- \text{type} is optional. \text{type} can be any one of:
  - ARM
  - THUMB
  - CODE32
  - CODE16
  - DATA

You can use \text{type} only if \text{expr} is an absolute address. If \text{name} is exported, the \text{name} entry in the symbol table in the object file will be marked as \text{ARM}, \text{THUMB}, \text{CODE32}, \text{CODE16}, or \text{DATA}, according to \text{type}. This can be used by the linker.

Usage

Use EQU to define constants. This is similar to the use of \texttt{#define} to define a constant in C.

Examples

- \text{abc EQU 2} \quad \text{assigns the value 2 to the symbol abc.}
- \text{xyz EQU label+8} \quad \text{assigns the address (label+8) to the symbol xyz.}
- \text{fiq EQU 0x1C, CODE32} \quad \text{assigns the absolute address 0x1C to the symbol fiq, and marks it as code}

See also

Reference

- \texttt{KEEP} on page 6-74
- \texttt{EXPORT or GLOBAL} on page 6-67.
6.8.8 EXPORT or GLOBAL

The EXPORT directive declares a symbol that can be used by the linker to resolve symbol references in separate object and library files. GLOBAL is a synonym for EXPORT.

Syntax

EXPORT {{WEAK}}
EXPORT symbol {{SIZE=n}}
EXPORT symbol {{type, set}}
EXPORT symbol [attr, type, set]{{SIZE=n}}
EXPORT symbol [WEAK, attr, type, set]{{SIZE=n}}

where:

symbol is the symbol name to export. The symbol name is case-sensitive. If symbol is omitted, all symbols are exported.

WEAK symbol is only imported into other sources if no other source exports an alternative symbol. If [WEAK] is used without symbol, all exported symbols are weak.

attr can be any one of:

DYNAMIC sets the ELF symbol visibility to STV_DEFAULT.
PROTECTED sets the ELF symbol visibility to STV_PROTECTED.
HIDDEN sets the ELF symbol visibility to STV_HIDDEN.
INTERNAL sets the ELF symbol visibility to STV_INTERNAL.

type specifies the symbol type:

DATA symbol is treated as data when the source is assembled and linked.
CODE symbol is treated as code when the source is assembled and linked.
ELFTYPE=n symbol is treated as a particular ELF symbol, as specified by the value of n, where n can be any number from 0 to 15.

If unspecified, the assembler determines the most appropriate type. Usually the assembler determines the correct type so there is no need to specify the type.

set specifies the instruction set:

ARM symbol is treated as an ARM symbol.
THUMB symbol is treated as a Thumb symbol.

If unspecified, the assembler determines the most appropriate set.

n specifies the size and can be any 32-bit value. If the SIZE attribute is not specified, the assembler calculates the size:

- For PROC and FUNCTION symbols, the size is set to the size of the code until its ENDP or ENDFUNC.
- For other symbols, the size is the size of instruction or data on the same source line. If there is no instruction or data, the size is zero.

Usage

Use EXPORT to give code in other files access to symbols in the current file.
Use the \([\text{WEAK}]\) attribute to inform the linker that a different instance of symbol takes precedence over this one, if a different one is available from another source. You can use the \([\text{WEAK}]\) attribute with any of the symbol visibility attributes.

**Example**

```assembly
AREA    Example, CODE, READONLY
EXPORT  DoAdd ; Export the function name
          ; to be used by external modules.
DoAdd   ADD     r0, r0, r1
```

Symbol visibility can be overridden for duplicate exports. In the following example, the last EXPORT takes precedence for both binding and visibility:

```assembly
EXPORT  SymA[\text{WEAK}] ; Export as weak-hidden
EXPORT  SymA[\text{DYNAMIC}] ; SymA becomes non-weak dynamic.
```

The following examples show the use of the SIZE attribute:

```assembly
EXPORT  symA [\text{SIZE=4}]
EXPORT  symA [\text{DATA, SIZE=4}]
```

**See also**

**Reference**

- *IMPORT and EXTERN* on page 6-71.
- *ELF for the ARM Architecture ABI*,
6.8.9  EXPORTAS

The EXPORTAS directive enables you to export a symbol to the object file, corresponding to a different symbol in the source file.

Syntax

EXPORTAS symbol1, symbol2

where:

symbol1 is the symbol name in the source file. symbol1 must have been defined already. It can be any symbol, including an area name, a label, or a constant.

symbol2 is the symbol name you want to appear in the object file.

The symbol names are case-sensitive.

Usage

Use EXPORTAS to change a symbol in the object file without having to change every instance in the source file.

Examples

AREA data1, DATA ; starts a new area data1
AREA data2, DATA ; starts a new area data2
EXPORTAS data2, data1 ; the section symbol referred to as data2 will appear in the object file string table as data1.

one EQU  2
EXPORTAS one, two
EXPORT one ; the symbol 'two' will appear in the object file's symbol table with the value 2.

See also

Reference
•  EXPORT or GLOBAL on page 6-67.
6.8.10 GET or INCLUDE

The `GET` directive includes a file within the file being assembled. The included file is assembled at the location of the `GET` directive. `INCLUDE` is a synonym for `GET`.

**Syntax**

```
GET filename
```

where:

*filename* is the name of the file to be included in the assembly. The assembler accepts pathnames in either UNIX or MS-DOS format.

**Usage**

`GET` is useful for including macro definitions, `EQU`s, and storage maps in an assembly. When assembly of the included file is complete, assembly continues at the line following the `GET` directive.

By default the assembler searches the current place for included files. The current place is the directory where the calling file is located. Use the `-i` assembler command line option to add directories to the search path. File names and directory names containing spaces must not be enclosed in double quotes (" ").

The included file can contain additional `GET` directives to include other files.

If the included file is in a different directory from the current place, this becomes the current place until the end of the included file. The previous current place is then restored.

`GET` cannot be used to include object files.

**Examples**

```
AREA Example, CODE, READONLY
GET file1.s                      ; includes file1 if it exists
     ; in the current place.
GET c:\project\file2.s          ; includes file2
GET c:\Program files\file3.s    ; space is permitted
```

**See also**

- `INCBIN` on page 6-73
- *Nesting directives* on page 6-29.
6.8.11 IMPORT and EXTERN

These directives provide the assembler with a name that is not defined in the current assembly.

**Syntax**

```
directive symbol {[SIZE=n]}
directive symbol {[type]}
directive symbol [attr{,type}{,SIZE=n}]
directive symbol [WEAK{,attr}{,type}{,SIZE=n}]
```

where:

- `directive` can be either:
  - `IMPORT` imports the symbol unconditionally.
  - `EXTERN` imports the symbol only if it is referred to in the current assembly.

- `symbol` is a symbol name defined in a separately assembled source file, object file, or library. The symbol name is case-sensitive.

- `WEAK` prevents the linker generating an error message if the symbol is not defined elsewhere. It also prevents the linker searching libraries that are not already included.

- `attr` can be any one of:
  - `DYNAMIC` sets the ELF symbol visibility to `STV_DEFAULT`.
  - `PROTECTED` sets the ELF symbol visibility to `STV_PROTECTED`.
  - `HIDDEN` sets the ELF symbol visibility to `STV_HIDDEN`.
  - `INTERNAL` sets the ELF symbol visibility to `STV_INTERNAL`.

- `type` specifies the symbol type:
  - `DATA` `symbol` is treated as data when the source is assembled and linked.
  - `CODE` `symbol` is treated as code when the source is assembled and linked.
  - `ELFTYPE=n` `symbol` is treated as a particular ELF symbol, as specified by the value of `n`, where `n` can be any number from 0 to 15.

If unspecified, the linker determines the most appropriate type.

- `n` specifies the size and can be any 32-bit value. If the `SIZE` attribute is not specified, the assembler calculates the size:
  - For `PROC` and `FUNCTION` symbols, the size is set to the size of the code until its `ENDP` or `ENDFUNC`.
  - For other symbols, the size is the size of instruction or data on the same source line. If there is no instruction or data, the size is zero.

**Usage**

The name is resolved at link time to a symbol defined in a separate object file. The symbol is treated as a program address. If `[WEAK]` is not specified, the linker generates an error if no corresponding symbol is found at link time.
If [WEAK] is specified and no corresponding symbol is found at link time:

- If the reference is the destination of a B or BL instruction, the value of the symbol is taken as the address of the following instruction. This makes the B or BL instruction effectively a NOP.
- Otherwise, the value of the symbol is taken as zero.

**Example**

The example tests to see if the C++ library has been linked, and branches conditionally on the result.

```
AREA    Example, CODE, READONLY
EXTERN  __CPP_INITIALIZE[WEAK] ; If C++ library linked, gets the address of
          __CPP_INITIALIZE function.
LDR     r0,=__CPP_INITIALIZE ; If not linked, address is zeroed.
CMP     r0,#0             ; Test if zero.
BEQ     nocplusplus       ; Branch on the result.
```

The following examples show the use of the SIZE attribute:

```
EXTERN symA [SIZE=4]
EXTERN symA [DATA, SIZE=4]
```

**See also**

**Reference**

- *ELF for the ARM Architecture*,
- *EXPORT or GLOBAL* on page 6-67.
6.8.12 INCBIN

The INCBIN directive includes a file within the file being assembled. The file is included as it is, without being assembled.

Syntax

INCBIN filename

where:

filename is the name of the file to be included in the assembly. The assembler accepts pathnames in either UNIX or MS-DOS format.

Usage

You can use INCBIN to include executable files, literals, or any arbitrary data. The contents of the file are added to the current ELF section, byte for byte, without being interpreted in any way. Assembly continues at the line following the INCBIN directive.

By default, the assembler searches the current place for included files. The current place is the directory where the calling file is located. Use the -i assembler command line option to add directories to the search path. File names and directory names containing spaces must not be enclosed in double quotes (" ").

Example

```
AREA Example, CODE, READONLY
INCBIN file1.dat ; includes file1 if it exists in the current place.
INCBIN c:\project\file2.txt ; includes file2
```
6.8.13 KEEP

The KEEP directive instructs the assembler to retain local symbols in the symbol table in the object file.

Syntax

KEEP {symbol}

where:

symbol is the name of the local symbol to keep. If symbol is not specified, all local symbols are kept except register-relative symbols.

Usage

By default, the only symbols that the assembler describes in its output object file are:

- exported symbols
- symbols that are relocated against.

Use KEEP to preserve local symbols that can be used to help debugging. Kept symbols appear in the ARM debuggers and in linker map files.

KEEP cannot preserve register-relative symbols.

Example

label    ADC     r2,r3,r4
KEEP    label       ; makes label available to debuggers
ADD     r2,r2,r5

See also

Reference

- MAP on page 6-17.
6.8.14 NOFP

The NOFP directive ensures that there are no floating-point instructions in an assembly language source file.

Syntax

NOFP

Usage

Use NOFP to ensure that no floating-point instructions are used in situations where there is no support for floating-point instructions either in software or in target hardware.

If a floating-point instruction occurs after the NOFP directive, an Unknown opcode error is generated and the assembly fails.

If a NOFP directive occurs after a floating-point instruction, the assembler generates the error:

Too late to ban floating point instructions

and the assembly fails.

6.8.15 REQUIRE

The REQUIRE directive specifies a dependency between sections.

Syntax

REQUIRE label

where:

label is the name of the required label.

Usage

Use REQUIRE to ensure that a related section is included, even if it is not directly called. If the section containing the REQUIRE directive is included in a link, the linker also includes the section containing the definition of the specified label.
6.8.16 REQUIRE8 and PRESERVE8

The REQUIRE8 directive specifies that the current file requires eight-byte alignment of the stack. It sets the REQ8 build attribute to inform the linker.

The PRESERVE8 directive specifies that the current file preserves eight-byte alignment of the stack. It sets the PRES8 build attribute to inform the linker.

The linker checks that any code that requires eight-byte alignment of the stack is only called, directly or indirectly, by code that preserves eight-byte alignment of the stack.

Syntax

REQUIRE8 {bool}
PRESERVE8 {bool}

where:

bool is an optional Boolean constant, either {TRUE} or {FALSE}.

Usage

Where required, if your code preserves eight-byte alignment of the stack, use PRESERVE8 to set the PRES8 build attribute on your file. If your code does not preserve eight-byte alignment of the stack, use PRESERVE8 {FALSE} to ensure that the PRES8 build attribute is not set. If there are multiple REQUIRE8 or PRESERVE8 directives in a file, the assembler uses the value of the last directive.

Note

If you omit both PRESERVE8 and PRESERVE8 {FALSE}, the assembler decides whether to set the PRES8 build attribute or not, by examining instructions that modify the SP. ARM recommends that you specify PRESERVE8 explicitly.

You can enable a warning with:

armasm --diag_warning 1546

This gives you warnings like:

"test.s", line 37: Warning: A1546W: Stack pointer update potentially breaks 8 byte stack alignment

37 00000044 STMFD sp!,{r2,r3,lr}

Examples

REQUIRE8
REQUIRE8 {TRUE} ; equivalent to REQUIRE8
REQUIRE8 {FALSE} ; equivalent to absence of REQUIRE8
PRESERVE8 {TRUE} ; equivalent to PRESERVE8
PRESERVE8 {FALSE} ; NOT exactly equivalent to absence of PRESERVE8
See also

Concepts

Reference
- Assembler command line options on page 2-3.

6.8.17 ROUT

The ROUT directive marks the boundaries of the scope of local labels.

Syntax

\{name\} ROUT

where:

name is the name to be assigned to the scope.

Usage

Use the ROUT directive to limit the scope of local labels. This makes it easier for you to avoid referring to a wrong label by accident. The scope of local labels is the whole area if there are no ROUT directives in it.

Use the name option to ensure that each reference is to the correct local label. If the name of a label or a reference to a label does not match the preceding ROUT directive, the assembler generates an error message and the assembly fails.

Example

; code
routineA ROUT ; ROUT is not necessarily a routine
; code
3routineA ; code ; this label is checked
; code
BEQ %4routineA ; this reference is checked
; code
BGE %3 ; refers to 3 above, but not checked
; code
4routineA ; code ; this label is checked
; code
otherstuff ROUT ; start of next scope

</tbody>
</table>

### Table A-4 Differences between issue B and issue C

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changed the restrictions to say that Rt must be even-numbered only in LDREXD and STREXD instructions.</td>
<td>LDREX and STREX on page 3-39</td>
</tr>
<tr>
<td>Mentioned the additional cases where SP and PC are deprecated.</td>
<td>• LDREX and STREX on page 3-39</td>
</tr>
<tr>
<td>• ADD, SUB, RSB, ADC, SBC, and RSC on page 3-50</td>
<td></td>
</tr>
<tr>
<td>• MOV and MVN on page 3-61</td>
<td></td>
</tr>
<tr>
<td>• B, BL, BX, BLX, and BXJ on page 3-116</td>
<td></td>
</tr>
<tr>
<td>• LDC, LDC2, STC, and STC2 on page 3-131</td>
<td></td>
</tr>
<tr>
<td>Mentioned that deprecation of SP and PC is only in ARMv6T2 and above.</td>
<td>Various instructions</td>
</tr>
<tr>
<td>Added example of inconsistent use of MAP and FIELD directives.</td>
<td>FIELD on page 6-18</td>
</tr>
<tr>
<td>Added note that the option is not required if you are using the ARM Compiler toolchain with DS-5.</td>
<td>• --workdir=directory on page 2-26</td>
</tr>
<tr>
<td>• --project=filename on page 2-21</td>
<td></td>
</tr>
<tr>
<td>• --no_project on page 2-20</td>
<td></td>
</tr>
<tr>
<td>• --reinitialize_workdir on page 2-23</td>
<td></td>
</tr>
<tr>
<td>Changed --cpu PXA270 to --device PXA270.</td>
<td>Introduction on page 5-2</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Change</td>
<td>Topics affected</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Updated the description of --cpu=name.</td>
<td>--cpu=name on page 2-8</td>
</tr>
<tr>
<td>Added the option --execstack.</td>
<td>--execstack on page 2-13</td>
</tr>
<tr>
<td>Added the option --no_execstack.</td>
<td>--no_execstack on page 2-18</td>
</tr>
<tr>
<td>Added the option --fmode=None.</td>
<td>--fmode=model on page 2-13</td>
</tr>
<tr>
<td>Updated the description of --show_cmdline.</td>
<td>--show_cmdline on page 2-23</td>
</tr>
<tr>
<td>Updated the instruction summary table and footnotes with ARMv7E-M.</td>
<td>Instruction summary on page 3-2</td>
</tr>
<tr>
<td>Replaced “profile” with “architecture” when referring to ARMv6-M,</td>
<td>Instruction summary on page 3-2</td>
</tr>
<tr>
<td>ARMv7-M, ARMv7-R, and ARMv7-A in the instruction summary table and</td>
<td></td>
</tr>
<tr>
<td>in the architecture sections of the instruction descriptions.</td>
<td></td>
</tr>
<tr>
<td>Mentioned register-controlled shift in the description of</td>
<td>Operand2 as a register with optional shift on page</td>
</tr>
<tr>
<td>Operand2.</td>
<td>3-46</td>
</tr>
<tr>
<td>Added register restrictions to ADR (PC-relative).</td>
<td>ADR (PC-relative) on page 3-24</td>
</tr>
<tr>
<td>Added register restrictions and deprecation information in LDR and</td>
<td>LDR and STR (immediate offset) on page 3-11</td>
</tr>
<tr>
<td>STR (immediate offset).</td>
<td></td>
</tr>
<tr>
<td>Identified the ARM only instruction syntaxes in LDR and STR (register</td>
<td>LDR and STR (register offset) on page 3-14</td>
</tr>
<tr>
<td>offset).</td>
<td></td>
</tr>
<tr>
<td>Added register restrictions and deprecation information, use of SP,</td>
<td>LDR and STR (register offset) on page 3-14</td>
</tr>
<tr>
<td>and use of PC in LDR and STR (register offset).</td>
<td></td>
</tr>
<tr>
<td>Noted that PC-relative STR is available but deprecated.</td>
<td>LDR (PC-relative) on page 3-19</td>
</tr>
<tr>
<td>Added information about deprecation and use of SP in LDR (PC-relative)</td>
<td>LDR (PC-relative) on page 3-19</td>
</tr>
<tr>
<td>In Restrictions of reglist in ARM instructions, added that</td>
<td>LDM and STM on page 3-30</td>
</tr>
<tr>
<td>reglist containing both PC and LR in ARM LDM is deprecated.</td>
<td></td>
</tr>
<tr>
<td>Added Restrictions of reglist in ARM instructions.</td>
<td>PUSH and POP on page 3-33</td>
</tr>
<tr>
<td>Added register restriction for Rn and moved the statement “Rn must</td>
<td>PLD, PLDW, and PLI on page 3-28</td>
</tr>
<tr>
<td>not be PC” to this section.</td>
<td></td>
</tr>
<tr>
<td>Added restrictions on reglist in LDM and STM.</td>
<td>LDM and STM on page 3-30</td>
</tr>
<tr>
<td>Added the statement “must not be PC” for each of the registers in</td>
<td>SWP and SWPB on page 3-43</td>
</tr>
<tr>
<td>the syntax.</td>
<td></td>
</tr>
<tr>
<td>Linked to SUBS pc, lr from Use of PC in ARM instructions.</td>
<td>ADD, SUB, RSB, ADC, SBC, and RSC on page 3-50</td>
</tr>
<tr>
<td>Removed the caution against the use of the S suffix when using PC</td>
<td>ADD, SUB, RSB, ADC, SBC, and RSC on page 3-50</td>
</tr>
<tr>
<td>as Rd in User or System mode.</td>
<td></td>
</tr>
<tr>
<td>Mentioned the deprecated instructions that use PC.</td>
<td>ADD, SUB, RSB, ADC, SBC, and RSC on page 3-50</td>
</tr>
<tr>
<td>Added more syntaxes that are only present in ARM code and</td>
<td>SUBS pc, lr on page 3-54</td>
</tr>
<tr>
<td>described the additional items in the syntax.</td>
<td></td>
</tr>
</tbody>
</table>
Table A-5 Differences between issue A and issue B (continued)

<table>
<thead>
<tr>
<th>Change</th>

</tr>
</thead>
<tbody>
<tr>
<td>Documented the valid forms of the <code>SUBS</code> instruction in ARM and Thumb, and added the caution to not use these instructions in User or System mode.</td>
<td><code>SUBS pc, lr</code> on page 3-54</td>
</tr>
<tr>
<td>Linked to <code>SUBS pc, lr</code> from Use of PC in ARM instructions and from See also section.</td>
<td><code>AND, ORR, EOR, BIC, and ORN</code> on page 3-56</td>
</tr>
<tr>
<td>Removed the caution against the use of the S suffix when using PC as <code>Rd</code> in User or System mode.</td>
<td><code>AND, ORR, EOR, BIC, and ORN</code> on page 3-56</td>
</tr>
<tr>
<td>Added Register restrictions section to say <code>Rn</code> cannot be PC in instructions that write back to <code>Rn</code>.</td>
<td><code>LDC, LDC2, STC, and STC2</code> on page 3-131</td>
</tr>
<tr>
<td>Mentioned that <code>Rt</code> cannot be PC.</td>
<td><code>MCR, MCR2, MCRR, and MCRR2</code> on page 3-126</td>
</tr>
<tr>
<td>Mentioned that <code>Rn</code> cannot be PC.</td>
<td><code>MSR</code> on page 3-138</td>
</tr>
<tr>
<td>Linked to <code>SUBS pc, lr</code> from Use of PC in ARM instructions.</td>
<td><code>MOV and MVN</code> on page 3-61</td>
</tr>
<tr>
<td>Removed the caution against the use of the S suffix when using PC as <code>Rd</code> in User or System mode.</td>
<td><code>MOV and MVN</code> on page 3-61</td>
</tr>
<tr>
<td>Mentioned the deprecated instructions that use PC.</td>
<td><code>MOV and MVN</code> on page 3-61</td>
</tr>
<tr>
<td>Mentioned that SP is not permitted in Thumb <code>TST</code> and <code>TEQ</code> instructions, and is deprecated in ARM <code>TST</code> and <code>TEQ</code> instructions.</td>
<td><code>TST and TEQ</code> on page 3-65</td>
</tr>
<tr>
<td>Added that <code>SEL</code> is available in ARMv7E-M.</td>
<td><code>SEL</code> on page 3-67</td>
</tr>
<tr>
<td>Added that <code>Rn</code> must be different from <code>Rd</code> in <code>MUL</code> and <code>MLA</code> before ARMv6.</td>
<td><code>MUL, MLA, and MLS</code> on page 3-76</td>
</tr>
<tr>
<td>Added that <code>Rn</code> must be different from <code>RdLo</code> and <code>RdHi</code> before ARMv6.</td>
<td><code>UMULL, UMLAL, SMULL, and SMLAL</code> on page 3-78</td>
</tr>
</tbody>
</table>
| Added that the Thumb instructions are available in ARMv7E-M. | • `SMULxy` and `SMLAxy` on page 3-80  
• `SMULWy` and `SMLAWy` on page 3-82  
• `SMLALxy` on page 3-83  
• `SMUAD{X}` and `SMUSD{X}` on page 3-85  
• `SMMUL`, `SMMLA`, and `SMMLS` on page 3-87  
• `SMLAD` and `SMLSD` on page 3-89  
• `SMLALD` and `SMLSLD` on page 3-91  
• `UMAAL` on page 3-93  
• `QADD, QSUB, QDADD, and QDSUB` on page 3-97  
• `Parallel add and subtract` on page 3-102  
• `USAD8` and `USAD16` on page 3-104  
• `SSAT16` and `USAT16` on page 3-106  
• `SXT, SXTA, UXT, and UXTA` on page 3-111  
• `PKHBT` and `PKHTB` on page 3-113 |
<p>| DBG is available in ARMv6K and above in ARM, and in ARMv6T2 and above in Thumb. Also mentioned that DBG executes as <code>NOP</code> in ARMv6K and ARMv6T2. | <code>DBG</code> on page 3-146 |
| Added figures 4-4 and 4-5 for the operation of <code>VSLI</code> and <code>VSRI</code>. | <code>VSLI and VSRI</code> on page 4-39 |</p>
<table>
