Chapter 1
Introduction

This chapter introduces the *ARM Design Simulation Model* (DSM) for SystemC. It contains the following sections:

- *DSM package contents* on page 1-3.
- *Simulation with DSMs* on page 1-4.
1.1 About Design Simulation Models

DSMs are cycle accurate, simulation models that you can include in a range of target HDL simulators. Each DSM is specific to a host platform. The DSM fully matches the architecture and functionality of the RTL model.

The DSMs are derived directly from the RTL model. DSMs can function with a wide range of industry-standard Verilog simulators. Performance depends on:

- The simulator interface efficiency.
- The complexity of the design in which it is instantiated.
- The complexity of the original design.

The DSM consists of:

- A functional core block.
- A SystemC wrapper.

The wrapper uses the foreign language interface of the host simulator to instantiate the functional model. The DSM is generally derived from the RTL source of the ARM design using the ARM Cycle Model compiler. For some ARM products, this might be augmented with extra functionality, such as TARMAC trace, added by ARM.

The DSM interfaces to the wrapper using technology developed by ARM to enable a single compiled model to function with a variety of logic simulators. For some products, the DSMs might include behavioral debug facilities, such as TARMAC trace. When you use compiled models, it enables distribution of models without compromising the intellectual property that they embody.

--- Note ---
The DSM is intended for functional simulation and verification only, not for timing or final design signoff.

1.1.1 Features of ARM DSMs

Table 1-1 shows the main features of ARM DSMs.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full device functionality</td>
<td>Unless otherwise noted, the DSM fully matches the architecture and functionality of the RTL model.</td>
</tr>
<tr>
<td>Phase accuracy</td>
<td>You can expect the DSM to exhibit the same intra-cycle timing as the RTL model.</td>
</tr>
<tr>
<td>Register visibility</td>
<td>For register visibility, use the TARMAC trace or see the included README for a list of registers that support visibility. Refer to the ARM TARMAC Specification available with your DSM installation.</td>
</tr>
<tr>
<td>Cache and memory size configuration</td>
<td>You can configure the size of the cache, or TCM, for each particular DSM instance, where applicable.</td>
</tr>
<tr>
<td></td>
<td>--- Note --- This feature does not apply if your ARM product has no such configuration, or where your DSM generation flow does not support multiple configurations.</td>
</tr>
<tr>
<td>Disassembler</td>
<td>To view disassembled code, use the TARMAC trace.</td>
</tr>
</tbody>
</table>
1.2 DSM package contents

Each DSM contains the following components:

- DSM SystemC wrapper.
- DSM library, including a dynamic .so file, static .a file, and header files.
- One or more implementation libraries as .so files.
- A testbench file to check the DSM setup.
- Documentation, including the ARM TARMAC Specification, this document, and a README.
1.3 Simulation with DSMs

Figure 1-1 shows the integration of DSMs (Block 1 and Block 2) into an HDL simulation. During simulation, the DSM interfaces to the simulator through the HDL to the SystemC Interface, which synchronizes between the two environments.

---

**Note**

For synthesizable cores, the DSM is a pre-implementation, pre-synthesis model. It does not contain any scan test insertion or BIST and is not a Sign-Off Model (SOM).
Chapter 2

Initial DSM Configuration

This chapter describes the functionality of the *ARM Design Simulation Model for SystemC* (DSM).

It contains the following sections:

- *Prerequisites* on page 2-2
- *Extracting and Installing the DSM* on page 2-3.
- *How to test the DSM* on page 2-4.
- *Integrating with Simulators* on page 2-5.
- *TARMAC Trace* on page 2-8
2.1 Prerequisites

This section describes prerequisites to using the DSM.

- DSM built and downloaded in .tgz format from ARM IP Exchange (www.armipexchange.com).
- GCC Compiler. If you are using Synopsys VCS, refer to the Synopsys documentation for the required gcc versions.
- Refer to the README file in your installation directory for specific tool versions required, model-specific limitations or restrictions, and supported registers.
2.2 Extracting and Installing the DSM

Before proceeding, ensure you have built and downloaded the `<dsm package>.tgz` for the desired IP from ARM IP Exchange (www.armipexchange.com).

2.2.1 Installing Using the Command Line

To install using the command line, follow the instructions below:

1. cd to the directory where you wish to install the DSM.
2. Extract the files from the `<dsm package>.tgz` as follows:
   ```
   % tar -xvzf <dsm package>.tgz
   gcc/EULA.pdf
gcc/docs
gcc/dsm
gcc/testbench
   ...
   
   The directory now contains the DSM release.
### 2.3 How to test the DSM

--- **Note** ---

You must set the DSM\_MODEL\_PATH environment variable to point to the directory that contains the DSM implementation libraries. If you do not set the variable, the [DSM MODULE NAME]\_TESTBENCH.sh script assumes the DSM\_MODEL\_PATH is one directory above the scripts location in the dsm directory. If the path is not set correctly, the simulator compiler exits with an error looking for the [DSM MODULE NAME] files or library files.

--- 

For all simulators, the module search path must include the path to the DSM libraries. Reference the [DSM MODULE NAME]\_TESTBENCH.sh for a detailed example. In the following sections, variables are defined as follows:

- [DSM PATH] is the path the DSM release dsm directory (i.e., $DSM\_RELEASE\_DIR/dsm).
- [DSM MODULE NAME] is the Component name specified on the portal.
- [PRODUCT NAME] is the ARM IP name.

Execute the [DSM MODULE NAME]\_TESTBENCH.sh executable within the expanded package to check that operation is valid. The DSM is contained within a testbench that is supplied with the package. The script requires that you select a system-installed simulator. You can specify the simulator to use by setting one of the following parameters:

- **vcs**: Selects the VCS simulator.
- **ius**: Selects the Cadence Incisive simulator.
- **mti**: Selects the QuestaSim simulator.

--- **Note** ---

The DSM is not intended for use with Accellera (OSCI) simulations.

--- 

A test that executes correctly prints the following message at the end of the simulation:

DSM: *** TEST PASSED ***
2.4 Integrating with Simulators

To use the DSM Model, add the following environment variables to your environment:

bash commands:
- `export PATH=[DSM_PATH]/univentUtil/bin:$PATH`
- `export LD_LIBRARY_PATH=[DSM_PATH]/univentUtil/lib:[DSM_PATH]:$LD_LIBRARY_PATH`

C shell commands:
- `setenv PATH [DSM_PATH]/univentUtil/bin:$PATH`
- `setenv LD_LIBRARY_PATH [DSM_PATH]/univentUtil/lib:[DSM_PATH]:$LD_LIBRARY_PATH`

2.4.1 VCS

To integrate the DSM with VCS:

1. Create the Verilog wrapper:
   ```
   syscan -full64 -sysc=230 -cflags "-DCM_SYSC_IO_UNIVENT_TARMAC -DCM_SYSC_REMOVE_SCOPE"
   [DSM_PATH]/[DSM MODULE NAME].cpp:
   ```

2. Add the following to the VCS command line:
   ```
   -full64 -sysc=230 -sysc=adjust_timers -LDFLAGS "$[DSM_PATH]/univentUtil/lib/[PRODUCT NAME]_tarmac_dpi.so $[DSM_PATH]/libcarbon5.so $[DSM_PATH]/lib[DSM MODULE NAME].a $[DSM_PATH]/univent_tarmac.cpp"
   ```

2.4.2 Cadence Incisive

To integrate the DSM with Cadence Incisive, add the following to the `irun` command line:

```
-64bit $[DSM_PATH]/univentUtil/lib/[PRODUCT NAME]_tarmac_dpi.so -sysc -scalitcher verilog
-DCM_SYSC_IO_UNIVENT_TARMAC -DCM_SYSC_REMOVE_SCOPE -I[DSM_PATH] -L[DSM_PATH]
[DSM_PATH]/[DSM MODULE NAME].cpp [DSM_PATH]/univent_tarmac.cpp -L[DSM_PATH] -lcarbon5 [DSM_PATH]/lib[DSM MODULE NAME].a
```

2.4.3 Mentor QuestaSim (ModelSim)

To integrate the DSM with Mentor QuestaSim:

Before running `vsim`, compile and link the libraries as follows:

```
sccom -64 -g -presuppress 6102 -DCM_SYSC_IO_UNIVENT_TARMAC -DCM_SYSC_REMOVE_SCOPE -I[DSM_PATH]
[DSM_PATH]/[DSM MODULE NAME].cpp [DSM_PATH]/univent_tarmac.cpp
sccom -64 -link -presuppress 6102 -L[DSM_PATH] -l[DSM MODULE NAME] -lcarbon5 [DSM_PATH]/univentUtil/lib/[DSM MODULE NAME]_tarmac_dpi.so
```
2.5 TARMAC Trace

This section describes enabling and disabling TARMAC trace.

2.5.1 Enabling TARMAC Trace

To enable the TARMAC trace, refer to the TARMAC specifications in the docs directory of the DSM release, or review the [DSM MODULE NAME]_TESTBENCH.sh file for the *TARMAC* environment variables.

You must also compile with the define CM_SYS_IO_UNIVENT (for example, -DCM_SYS_IO_UNIVENT) to enable.

2.5.2 Disabling TARMAC Trace

To disable the TARMAC trace, remove the CM_SYS_IO_UNIVENT define from the compile. Or, set the environment variable TARMAC_ENABLE to never.
Chapter 3
Model Limitations

This chapter contains the following sections:
• Limitations of use on page 3-2.
### 3.1 Limitations of use

Although DSMs match the architecture and functionality of the appropriate core designs, they are subject to the limitations that the following sections describe:

- Supported simulators
- Unsupported simulator functions
- Internal scan chain modeling
- Caches and registers

#### 3.1.1 Supported simulators

The DSM model is limited to Linux 64-bit. It has been tested and is supported on the following simulators:

- Synopsys VCS
- Cadence Incisive
- Mentor QuestaSim

#### 3.1.2 Unsupported simulator functions

The following simulator functions are not supported:

**Save and Restore, also known as checkpointing**

Save the simulation at a determined point of time, also known as a snapshot, and restore the simulation to that point of time.

**Power-aware simulation**

Power-aware simulation.

#### 3.1.3 Internal scan chain modeling

DSMs are derived from the RTL description of the core that they model. The final netlist for the core might contain internal scan chains that were added during synthesis. It is not possible to use DSMs to model these scan chains because they do not exist in the device RTL. However, the Sign-Off Model (SOM) of a device models the scan chains.

#### 3.1.4 Caches and registers

The DSM Model provides visibility into certain registers. Refer to the README file included with your DSM Model for a list of supported registers.

#### 3.1.5 Waveform dumping

Refer to the README file included with your DSM Model for instructions and limitations of Waveform dumping for your particular model.
